

How to stream live to YouTube with Raspberry Pi

By adding a camera module to the Raspberry Pi, you basically get a mobile Internet camera, compact and easy to hold or attach somewhere.

By adding a camera module to the Raspberry Pi, you basically get a mobile Internet camera, compact and easy to hold or attach somewhere.

If you want to stream footage with this module, do you know where to start? Which Pi model should you use? Where is the camera module solution better in this case? And how do you live streaming YouTube footage? As with most things on Raspberry Pi, these things are very simple.

Guide to streaming videos to YouTube with Raspberry Pi

1. Why choose live streaming with Raspberry Pi?
2. What do you need to prepare?
3. Set up YouTube channel
4. Prepare Raspberry Pi to stream directly to YouTube
5. Establish transmission with avconv
6. What does the stream command mean?
7. Split session SSH to play online

Why choose live streaming with Raspberry Pi?

With so many different devices capable of streaming live on YouTube, are you wondering why you chose Pi?

First, the size of the Raspberry Pi certainly works, allowing you to position Raspberry Pi in almost every position. Secondly, using Pi as a dedicated YouTube live camera also frees other devices.

Operations can be a bit lengthy, requiring a long series of commands, but the results will definitely satisfy you.

What do you need to prepare?

To stream anything with the Raspberry Pi directly to YouTube, you'll need the following:

1. A Raspberry Pi 3 or above.
2. Raspberry Pi camera module (original version or NoIR are available). (Although you can use a USB webcam, these instructions assume you are using the Raspberry Pi camera module).
3. Backup battery power (optional).

For the operating system, standard Raspbian Stretch will be fine. But you can also choose Ubuntu or Arch Linux or any other Raspberry Pi distribution available.

Next, connect the camera and start up. You will also need a YouTube channel to stream your footage live. This process is not as difficult to set up as you think.

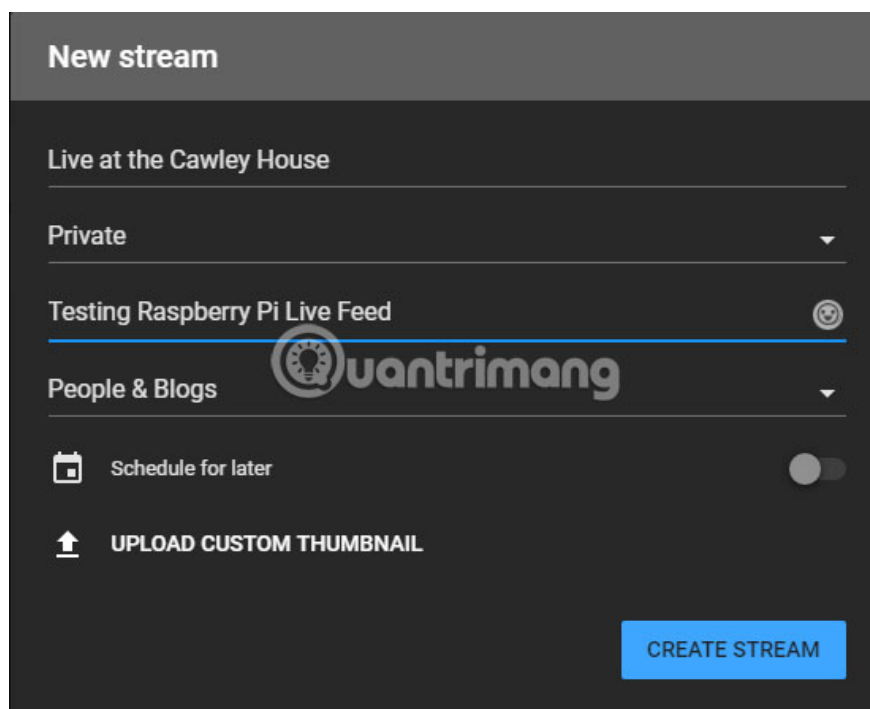

Set up YouTube channel

You may already have a YouTube account. If you use Google Mail, there is an account ready to activate. You will need a special URL from here to transfer the footage recorded by the Raspberry Pi camera to YouTube.

This is called the RTMP address and is basically a specific media URL.

To find this address, visit YouTube, log in and find the **Upload** button . Here are the steps you usually use in YouTube to add videos. However, in this case, we will ignore this and click the **Get started** button in **Live Streaming**.

In the next screen, fill in the details you want for the live feed. This will be information related to the topic of the feed and the title you should add in **Basic Info**. You will also have the opportunity to set privacy levels for streams (**Public**, **Unlisted** or **Private**).

The image shows a screenshot of the YouTube 'New stream' setup interface. The title is 'Live at the Cawley House'. The privacy is set to 'Private'. The title is 'Testing Raspberry Pi Live Feed'. The channel is 'People & Blogs' with a watermark for 'uantrimang'. There is a 'Schedule for later' toggle switch which is currently off. There is an 'UPLOAD CUSTOM THUMBNAIL' button. At the bottom right, there is a blue 'CREATE STREAM' button.

In the next tab, **Stream key setup** , find **Stream URL** and **Stream name / key** (you need to click **Reveal** to see this information). Note that the **Stream key** must be secure because anyone with this information can stream it directly to your YouTube channel!

Stream key setup

Do you have third-party streaming software?

If you don't, the first step is to [choose and download streaming software](#). Then copy and paste the stream URL and stream key shown here into your software.

Stream URL
`rtmp://a.rtmp.youtube.com/live2`

Stream name/key (paste in encoder)
.....

(If you want to set up Pi streaming via SSH, just copy the **Stream name / key** from the YouTube browser window to the command line of Raspberry Pi remotely).

To see other options here, see the tutorial: [How to play live video on YouTube?](#) from **TipsMake.com**.

Prepare Raspberry Pi to stream directly to YouTube

Now, it's time to set up Raspberry Pi for streaming.

Start by upgrading. This step ensures you can run the latest Raspbian version, with all necessary system and software updates, including raspivid.

```
sudo apt update sudo apt upgrade
```

This step will take a few minutes to complete. Once completed, open a terminal window and enter:

```
sudo raspi-config
```

Use the arrow keys to select **Enable Camera**, press **Enter** , then select **Yes**. You will be prompted to restart. When Pi restarts, enter:

```
raspistill -o image.jpg
```

You will find results in the Home folder. When you know for sure that the camera is working with the Raspberry Pi, you can continue.

Establish transmission with avconv

The most recent versions of Raspbian have been pre-installed with **avconv**, so you don't need to install it. However, if you don't want to upgrade your Raspberry Pi, just install the **libav-tools** package :

```
sudo apt install libav-tools
```

Once **avconv** is installed, you are ready to create a feed for YouTube. You may need **Stream name / key** that you recorded earlier for this.

However, the command is quite long:

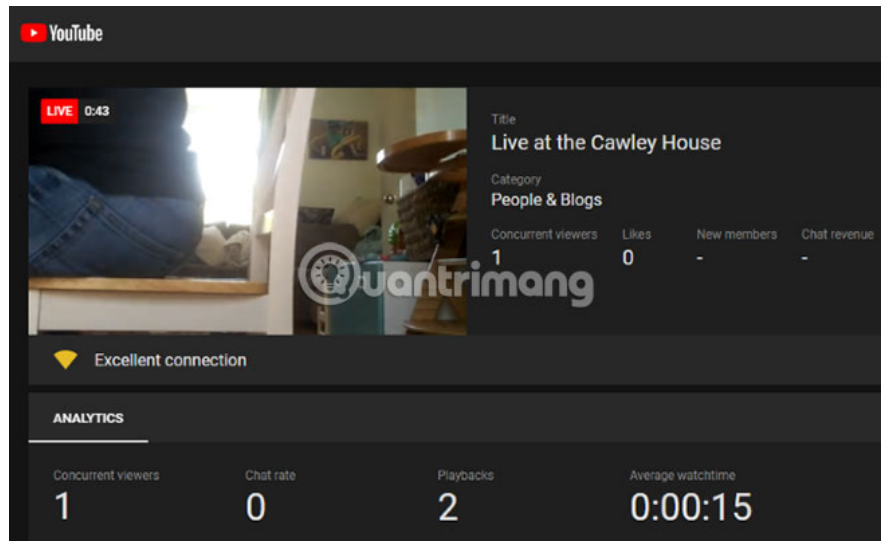

```
raspivid -o - -t 0 -vf -hf -fps 30 -b 6000000 | avconv -re -ar 44100 -ac 2 -acodec
```

As you can see, the command has many factors. Now, if you want to continue and run it, copy the code, paste it into the terminal window and press **Enter** . Remember to change the **[your-secret-key-here]** to **Stream key** that you noted earlier.

If everything works as intended, you'll end up with the following result:

```
Duration: N/A, bitrate: N/A
Stream #1:0: Video: h264 (High), yuv420p(progressive), 1920x1080, 25 fps, 25
tbr, 1200k tbn, 50 tbc
Output #0, flv, to 'rtmp://a.rtmp.youtube.com/live2/8vu9-mhbw-h8k2-33mk':
Metadata:
  encoder      : Lavf57.56.101
  Stream #0:0: Video: h264 (High) ([7][0][0][0] / 0x0007), yuv420p(progressive
), 1920x1080, q=2-31, 25 fps, 25 tbr, 1k tbn, 1200k tbc
  Stream #0:1: Audio: aac (LC) ([10][0][0][0] / 0x000A), 44100 Hz, stereo, flt
p, 128 kb/s
Metadata:
  encoder      : Lavc57.64.101 aac
Stream mapping:
  Stream #1:0 -> #0:0 (copy)
  Stream #0:0 -> #0:1 (pcm_s16le (native) -> aac (native))
[flv @ 0x215b620] Timestamps are unset in a packet for stream 0. This is deprec
ted and will stop working in the future. Fix your code to set the timestamps pro
perly
[h264 @ 0x1fc36f0] Thread message queue blocking; consider raising the thread_q
ueue_size option (current value: 8)
frame= 13 fps=0.0 q=-1.0 size=      212kB time=00:00:00.51 bitrate=3402.1kbits/
frame= 26 fps= 26 q=-1.0 size=      573kB time=00:00:01.02 bitrate=4601.4kbits/
frame= 39 fps= 26 q=-1.0 size=      930kB time=00:00:01.52 bitrate=5009.4kbits/
speed= 1x
```

When this happens, return to the YouTube browser tab. A moment later, the footage will start streaming:

What does the stream command mean?

The long command above can be quite confusing for beginners, but contains a separate set of parameters. Look at the most important thing.

1. **-fps:** This is the frame rate per second (frames per second). For best results, this speed must be above 24. However, if performance is an issue, you may want to reduce this ratio to improve the stream.
2. **-w -h:** They can be used to specify width and height. If you ignore them, raspivid will use 1920 × 1080 (1080p) high resolution resolution.
3. **-b:** Output bitrate limit (bitrate is the amount of data transmitted over a certain time period). YouTube's proposal is 400-600kbps. A lower number will reduce the upload bandwidth, make the video lower quality.
4. **-acodec:** This parameter is especially important for streaming to YouTube. This service does not allow video without audio (or audio but no images), so the example uses this to create fake audio for the stream. Because Raspberry Pi has no built-in mic and the best sound results are obtained, it requires additional

HAT sound cards (this is an easy solution).

5. **-f:** This is the output format. In this case, it's flv, the preferred format for live streams on YouTube.

Split session SSH to play online

The raspivid command above will initialize a stream, but if you are connecting via SSH, when you disconnect, the thread will close. Surely you can't let the computer run just so that Pi continues to transmit, right?

Fortunately, there is a solution to this problem. It is a **screen**. This is a software you can install, which helps keep the SSH session running when you disconnect.

Start by ending the stream (`Ctrl + X`), then install the screen:

```
sudo apt install screen
```

Wait for the installation screen to finish, then restart Pi.

```
sudo reboot
```

Reconnect via SSH, log in, then enter the command to run the screen:

```
screen
```

This basically creates a separate environment for you to run the raspivid command, an environment that will exist when you disconnect. Simply run raspivid as above, then when you are ready to disconnect, press `Ctrl + A`

Close the SSH window and the stream will continue.

With live video from the camera on Pi, everything will work well. All you need is:

1. Connect camera module with Raspberry Pi
2. Position Pi to record the scene
3. Run system update
4. Set up YouTube channel and copy URL stream
5. Start a stream with the raspivid command

Note that with continuous streaming, it is possible that all devices may be too hot, this will slow down the stream. If this happens, consider some Raspberry Pi cooling solutions.

Hope you are succesful.
