

How to switch to computer screen mode on Safari for mobile

Safari is rated extremely well and always optimized on mobile devices. However, not all websites are suitable for loading on Safari.

Safari is rated extremely well and always optimized on mobile devices. However, not all websites are suitable for loading on Safari, there are still many websites that are not compatible with this browser of iOS or simply that website has not provided a mobile user experience. In these cases, Safari allows you to switch the view to the computer version to make it easier to work.

So how to do it? Follow the guide of [TipsMake.com](https://www.tipsmake.com).

How to switch mobile view on Safari to desktop style

Like some other features on iOS, Safari's Request Desktop Site is hidden but not available for you to use. With iOS 13, Apple changed the location of this option, making it a little easier to find. Note that the iPadOS 13 automatically loads websites according to the computer screen so you won't need to switch if you are in this new update.

Here we will show you how to do it on iOS 12 and iOS 13.

From iOS12 and earlier

Open the Safari application on your iPhone or iPad and download a website. Next, touch and hold the **Refresh** button next to the URL bar.

In the menu that appears at the bottom of the screen, click **Request page for desktop**.

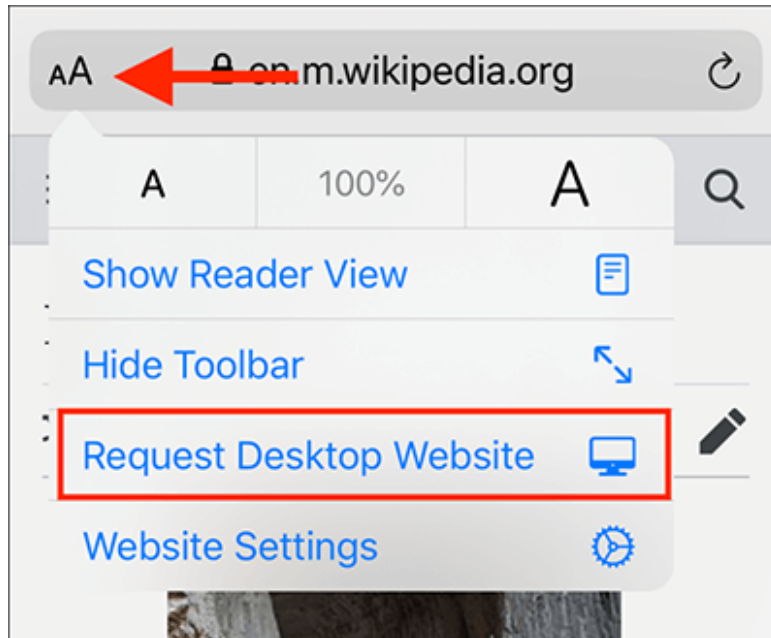

The website will load again and now you have the results and the web displayed as a computer screen.

To return to the old mode, do the same as holding the **Refresh** button and select **Request page for mobile**.

From iOS 13 and above

With iOS 13 update, Apple has improved some important points in the Safari browser. While most changes are most clearly improved in the browser on the iPad, iPhone users also get some advantages that easily access the Safari Download Manager or some new features within the custom menu. Edit web pages.

Back to the article content, click the **aA** icon next to the URL bar to see some new options in the menu. Next, click on **Request page for desktop** to finish.

Back to mobile view, repeat the operation to switch back to the old view.

Simple as that. Please try it.
