

How to take a screenshot of a website in Chrome does not need a utility

To take a screenshot of a website in Chrome, we can use Chrome's built-in tool right away.

To take a screenshot of your computer screen, use the shortcut on the screen immediately, or use some of the Windows 10 photography tools available such as Snipping Tool, Snip Editor. However, these tools only have the option to capture the content displayed on the screen, or the selected content area, without the option to capture the entire website screen.

If you want to take a photo of a website, users must use the utility to capture on Chrome or online screen capture websites. However, even on Chrome, there was a screenshot of the website screen, but it was hidden. Read the following article to take a screenshot of the website on Chrome.

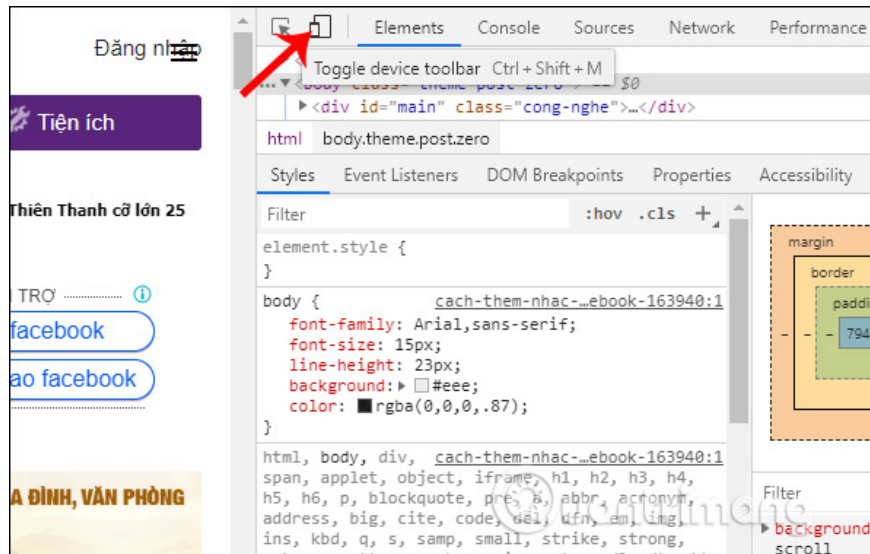

1. How to take photos of the website, capture the whole website on Chrome and Firefox
2. Ways to take screen shots of Android phones
3. Instructions for filming and taking game screen shots in Windows 10
4. To take a photo of a web page using the "multi-function" Marker

Guide to photographing websites on Chrome

Step 1:

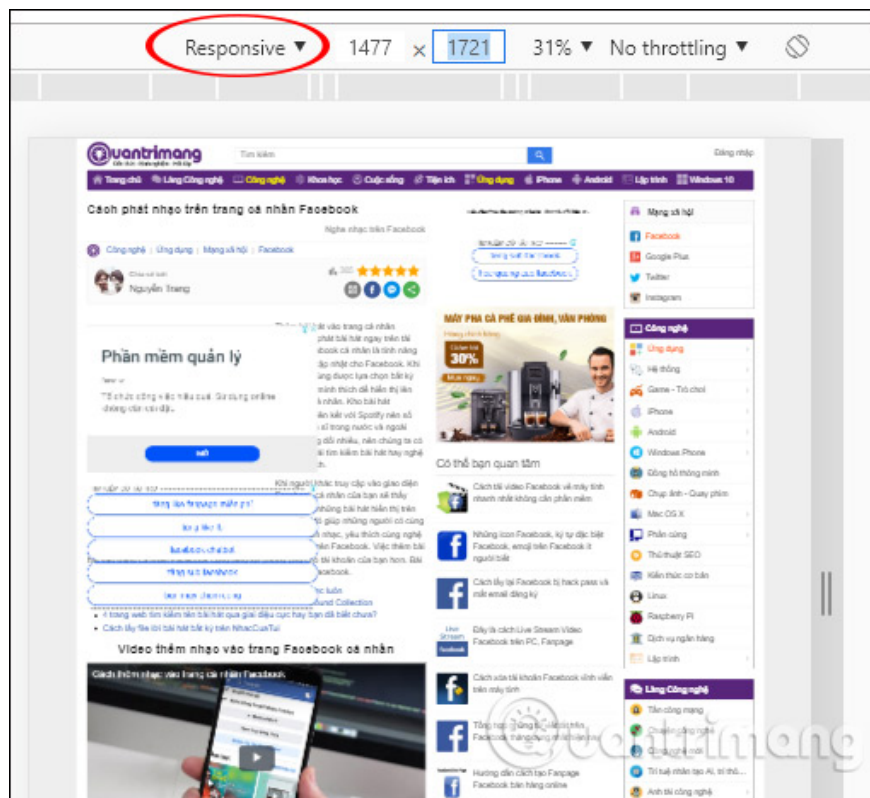

First of all, you need to open a website that wants to take full screen photos on Chrome. Next press **the F12 key combination** to open the Inspect interface on the browser.

In the interface displayed right on the screen, we click **the Toggle device toolbar icon** to display the website resolution bar.

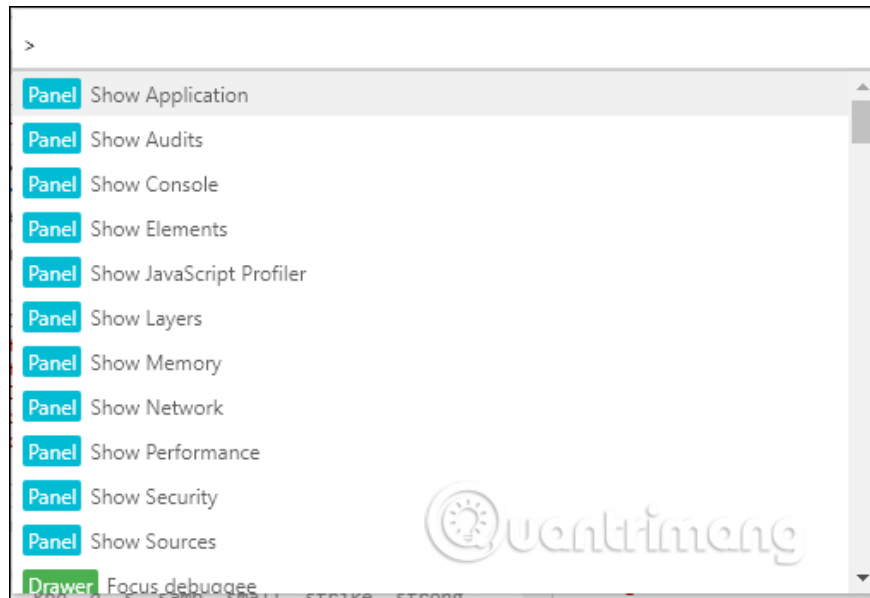

Step 2:

Immediately above the top of the website interface displays the size bar. Users **enter sizes for web pages** to display. You should enter a large size for both the horizontal and vertical dimensions of the web page to make it easier to save the image.

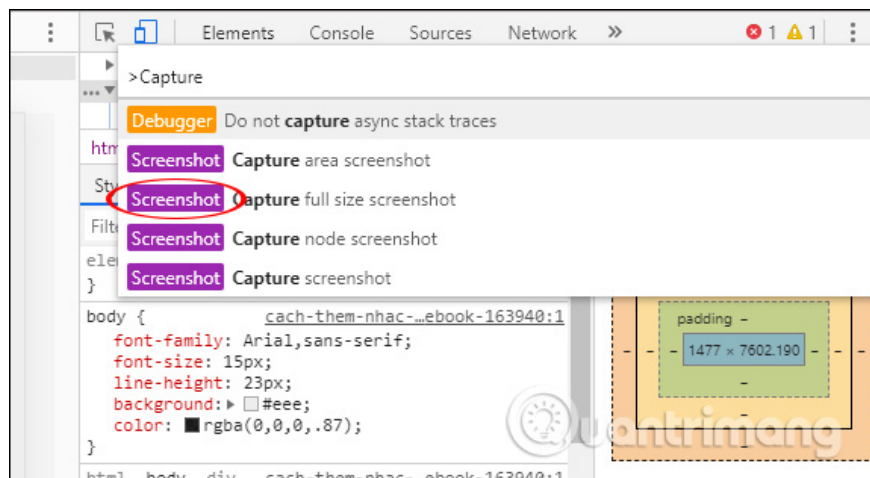

Step 3:

Once you've selected the size for the screenshot of the website, press **Ctrl + Shift + P** to open the command prompt on Chrome.

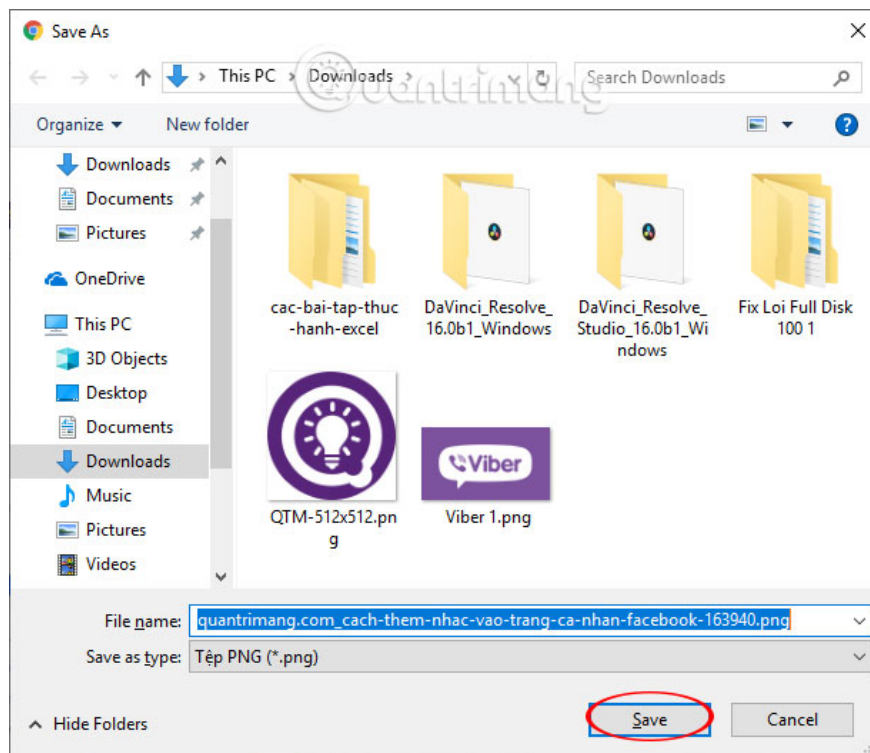

In the top bar **enter the Capture keyword** and then click on the **Capture full size screenshot** as shown below to select the entire contents of the open website.

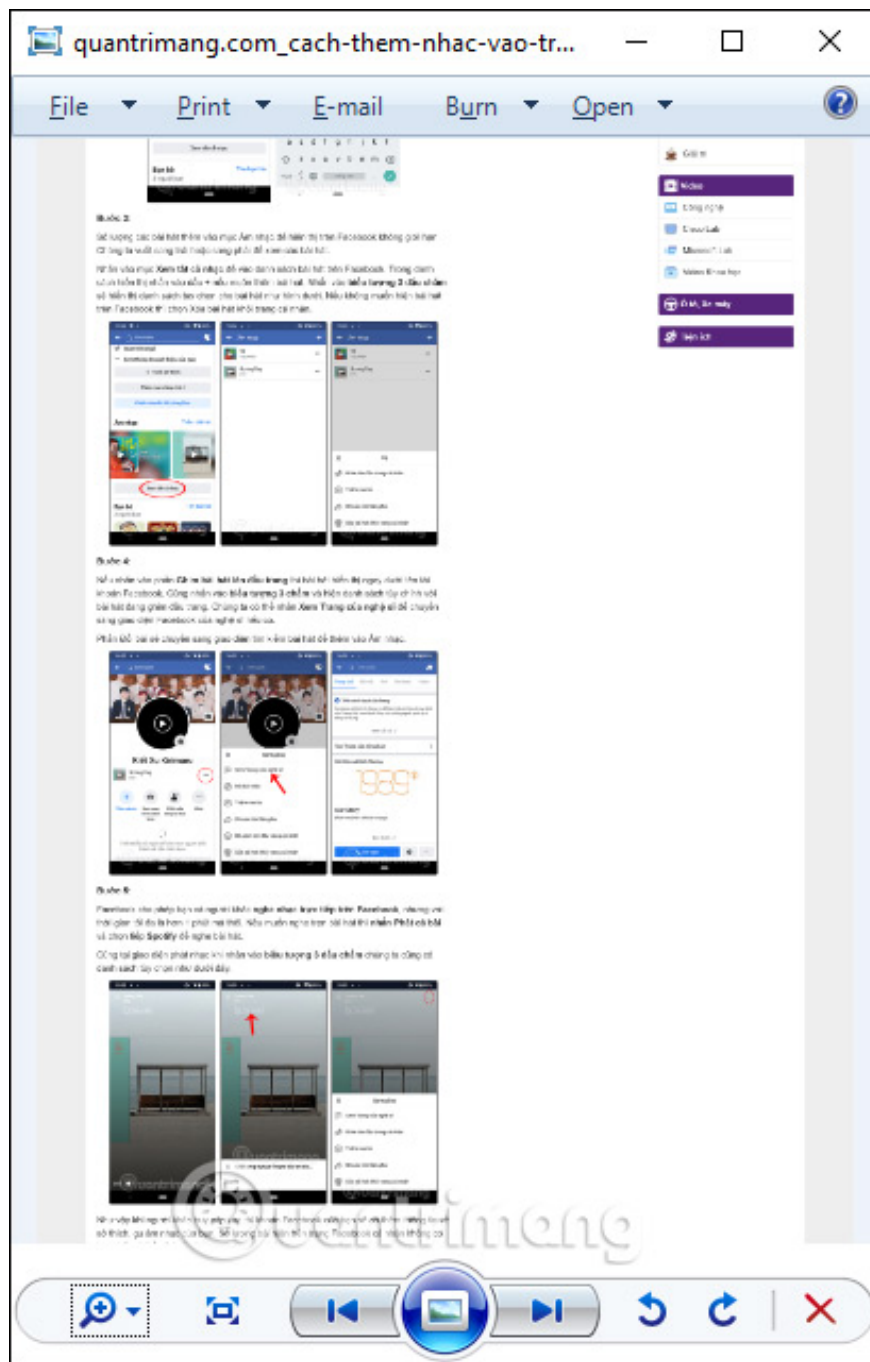

Step 4:

You wait for Chrome to load the content and take a screenshot. Then display the folder on the computer with the image name as the website name and the title of the content for the open website. Photos are saved by default as png. Click **Save** to save.

As a result, we open the image and see the entire content of the website captured as shown below. Because images are saved in large sizes, we can easily zoom in or zoom out without breaking the image or blurring the text.

Very easy, isn't it ?! There is no need to use another support tool, but you can take full picture of website content right on Chrome. After taking a photo, use photo editing software to adjust the image if you want.

I wish you all success!
