1. Prepare the hardware

- To project from a computer to two monitors, we must prepare a cable connected to the monitor and the monitor must support a standard connection on the computer such as HDMI, VGA . If your computer has only one port If the image is VGA or HDMI, you can find and use image splitters such as dual VGA, Dual HDMI . However, the image when outputting two monitors with the same cable may appear delay or asynchronous picture error, does not recognize the dual screen function.

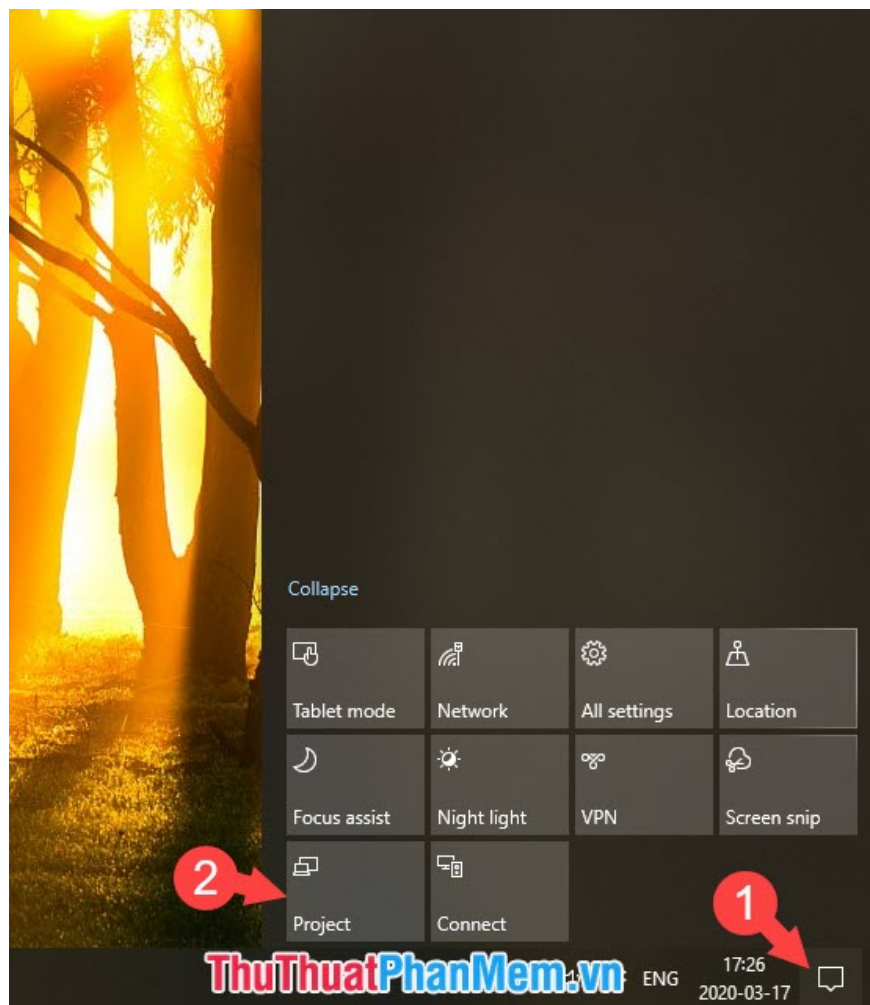

Instead of using a signal splitter cable, the best solution for using two monitors effectively is to use a discrete graphics card that supports multiple image signal ports such as HDMI, DVI, Display Port . then we can work with two monitors efficiently and drivers on the graphics card models that support the use of two monitors on the computer. In addition, we also enjoy sharp, beautiful images and good frame sync capabilities if both the monitor and the graphics card support synchronization features such as Nvidia G-sync or AMD Free Sync.

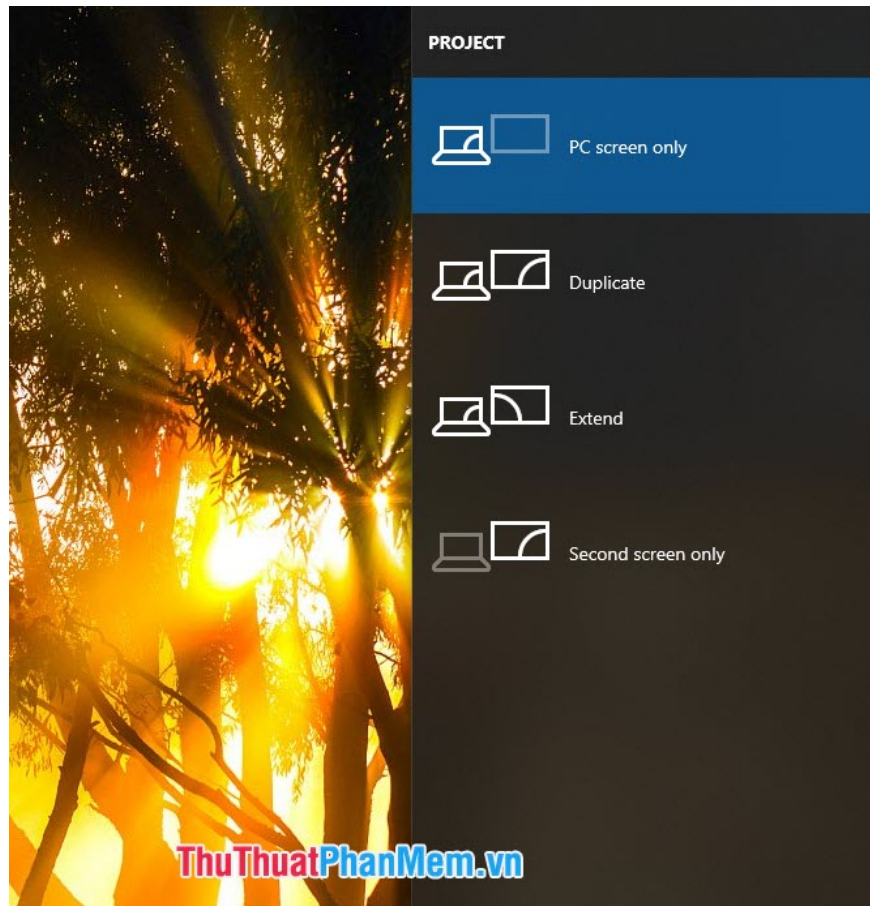

On some laptops equipped with both VGA and HDMI ports, we can use these two ports to output images to the screen, but the image signal via the VGA port will not be as good as the signal via the HDMI port. This is overcome by some newer laptops with USB Type C or Thunder Bolt that will improve the image quality compared to the old VGA port.
