

How will the new MacBook get more upgrades?

After a year of not officially launching a new laptop, Apple is preparing for the event in a very thoughtful, majestic way to welcome the latest member of the Macbook.

After a year of not officially launching a new laptop, Apple is preparing for the event in a very thoughtful, majestic way to welcome the latest member of the Macbook.

The Macbook Air, Macbook Pro and Pro Retina in 2014 were only slightly upgraded by the manufacturer as well as improved operating systems instead of being refreshed as every year. Therefore, the event that will take place on March 10 will be very much expected when many possibilities are available: a new laptop will be released (Macbook Air Retina) along with radical improvements in terms of configure, expand connectivity and the ability to use batteries longer for older models. Here are the predictions about the configuration and technology will be equipped on the 2015 Macbook series.

MACBOOK AIR RETINA

The Macbook Air is Apple's most prominent success after the launch of the Ultrabook definition that Intel introduced to the market. Over the past time, the Macbook Air has been very successful with its ultra-slim design, good keyboard, stable performance, beautiful Mac OS, optimized and especially the battery life is always top on the tables. Global Ultrabook ranking. However, within the past 1 year, Apple devices have been frustrated with representatives using the Windows platform. The sample Ultrabook Windows possesses the advantage of configuration, the screen has also been raised to super high resolution, super-fast connection ports, high-capacity SSD and besides the battery life is gradually being raised. high. Therefore, the Macbook Air has no more words before the opponent and it is time for Apple to do something.

One of the features expected on the new Macbook Air is the ultra-high resolution (Retina) screen like the previous Macbook Pro series. Many Apple fans believe that the right Air Retina Macbook was released in 2014, but what happened in Cupertino in October made them disappointed.

However, Apple also has its own reasons, the company said that the battery life will be significantly reduced after using the Retina screen and this lost the identity of the Macbook Air. Increasing the number of pixels on the screen will make the device consume more battery power and Apple has halted production to wait for Intel's new Broadwell processor. In addition, connectivity issues, new design, keyboard, trackpad are also upgraded separately for this product line by Apple.

A reliable information recently leaked that the Macbook Air will only have a single version with a 12.2-inch screen and the price will not be pleasant at the time of launch. Anyway, we will be waiting on the presence of this device on the night of 9/3 on March 10 morning.

MACBOOK AIR

The device equipped with Retina screen for Macbook Air is being prepared urgently by Apple, however, the company will not ignore the child to make the highest success during the past time. Unlike 2014 with just a slight upgrade, Apple will equip the new Macbook Air with Intel Core i5-5250U 2.2GHz, Core i5-1.8GHz and Core 2 i7 Core i7 processors, keeping the same 2 sizes of 11-inch and 13-inch screens. RAM capacity is still optimized at 4 GB and 8 GB, and the company is also ready to allow users to expand the configuration through ordering on the Appstore. In terms of memory, the new SSD on the Macbook Air will be especially improved in terms of data writing speed. The design is likely to remain the same for the Macbook Retina.

MACBOOK PRO AND PRO RETINA

Like the Macbook Air, the Macbook Pro series will be upgraded to the latest Broadwell processor and LPDDR4 RAM to provide better battery savings than the old version. In terms of design, many reviews show that a new Macbook Pro has a look similar to the Macbook Air with a more impressive thinness, but still ensures sufficient number of connection ports and speaker positions like the old version. And of course, all new MacBooks will have a new Type-C USB port to save space, for optimal thinness.
