1. Depending on the damage level of the super speed tank

Superheated kettles when broken can be divided into two levels: slight damage and severe damage.

1.1. Low

At a minor level of failure you can repair and use it yourself without buying a new one. With a slight failure, the error will encounter the following errors and a simple remedy:

The boiling but warm water has automatically disconnected

Cause: Due to the long-term use of warm but less hygienic, it often happens that the encrusting condition at the bottom of the bottle leads to the consequences of damaging the thermal sensor relay that causes the water not yet boiled to automatically disconnect the power.

Remedy: For tap water, it is not filtered through a water filter that has very dirty deposits, so when the kettle is heated, these deposits will stay there. So you need to clean the bottom of the super speed tank regularly and clean the relay (every 2 weeks).

The water has boiled but warm has not automatically disconnected

Cause: Since you have not closed the lid tightly, the thermal relay sensor will incorrectly determine the measured value, so when the boiling water is still warm, do not disconnect the power automatically.

Remedy: Before turning on the boil switch you need to check if the lid is closed properly. Because only when the cover is closed, the thermal relay automatically disconnects the power.

Do not press the switch to boil water

Cause:

1. Case 1: Maybe because you have not poured water to the minimum water mark, the switch will not turn on.
2. Case 2: Because you repeatedly boil water too many times, the heat tray is overheated so the switch will not turn on.

How to fix:

1. Case 1: You need to pour water on the minimum water mark and below the Max line as recommended by the manufacturer.
2. Case 2: When the relay tray of the kettle is overheated, the relay in the heat sink will automatically disconnect the electrical circuit, so you should not continue the habit of continuously heating the water to

allow the kettle to cool down first. when operating again.

In the case of superhigh speed damaged such as plastic flow, distorted, it should not be repaired, but buy another kettle to use. Because warm distortion will cause the relay to no longer be sensitive and prone to jumping early or not automatically disconnecting the power.
