

# Iframe in HTML

In HTML, iframe is used to display a web page within another website.

## Iframe syntax

iframe HTML is defined by tag

The `src` attribute is used to determine the URL (web address) of the page within the inline frame.

## Iframe - set height and width

The `height` and `width` attributes are used to determine the size of an iframe. The default attribute value is pixels but can be used as a percentage (eg 80%).

Or you can use CSS to set the height and width for iframe.

## Iframe - remove borders

By default, iframe will have a border around it. To remove this border, add `style` properties and use the CSS property as `border`.

With CSS, you can also change the size, style, and color of iframe borders.

## Iframe - destination for the path

Iframe can be used as the target frame for the path. The `target` attribute of the link must refer to the name attribute of the iframe.
