

In the morning, he found his stomach emitting music because he accidentally swallowed the wireless headset while sleeping, and after running it still ran fine

A man in Taipei (Taiwan, China) has encountered a strange accident: swallowing his wireless headset while sleeping.

A man in Taipei (Taiwan, China) has encountered a strange accident: swallowing his wireless headset while sleeping.

Somehow, Xu's pair of wireless headphones (the name may have been changed) had 'sneaked' into his stomach when he slept. After waking up, Xu fumbled for his wireless pair of headphones but didn't see it. Suddenly, he heard his stomach make music. He quickly went to the hospital to check and was not surprised when he heard the doctor announce the pair of wireless headphones that he was looking for "peacefully" in his stomach.

An X-ray shows the headset in the patient's stomach.

After the incident, Mr. Xu posted a photo of his pair of headphones after washing them and said they still work well.

Wireless headsets are an inevitable trend in the current technological age. Although compact and fashionable, this is something that is easy to fall or lose. In order to secure a more robust wireless headset, some manufacturers also create parts attached to the ear ring or as Apple has even released the application to find

Airpods (its wireless headphones) lost.

Wear a wireless headset. Artwork: Internet.

In addition, parents with young children also need to be careful when using wireless headsets because children may accidentally swallow, obstructing the airways.
