

Inserting video in HTML5

How to insert a video into HTML? If you're looking to learn how to embed a video into your HTML website, please refer to the article below.

Inserting videos into HTML5 isn't difficult. Here's a detailed guide on how to add videos to your HTML website.

Video and audio on the web

The initial boom in online video and audio was driven by proprietary plugin-based technologies like Flash and Silverlight. Both technologies suffered from security and accessibility issues and are now obsolete, giving way to native HTML solutions.

Element

Explanation of the above example:

- **The controls** property in the example above will add video controls, such as: play, pause, zoom, and volume.
- **You should add the width** and **height** attributes to ensure that the video frame will be fixed during site loading.
- **The source** element allows you to specify alternative video files that the browser can choose from. By default, the browser will use the first recognized format.
- The text content between tags will only be displayed when running on browsers that do not support tags.

Note : In most cases, Chromium-based browsers do not allow autoplay. If they do, the video will always be muted when playing automatically.

Add "**muted**" after "**autoplay**" so your video will always autoplay (but with the sound muted):
