

Instructions for cleaning the air conditioner properly

Some parts of the user need to pay special attention when cleaning the air conditioner fan, the cooling plate, the filter, the fan body and the water tank of the air conditioner fan.

Air conditioner is one of the modern cooling devices that many people find to buy in the summer, but not everyone knows how to clean the air conditioner properly to help fans work well and ensure safety strong. Some parts of the user need to be special when cleaning the air conditioner fan, the cooling plate, the filter, the fan body and the water tank. Here are detailed instructions on how to clean the air conditioner fan that you can refer to.

1. How to use an effective air conditioner fan
2. Should I buy an air conditioner in summer?
3. Notes when using air conditioner for children

1. Clean the cooling plate of the air conditioner fan

Cooling panels are also known as heat exchangers, which play an important role in the operation of air-conditioning fans. To ensure the fan's cooling plate works effectively, you should clean it once a month by using a soft bristle brush to remove dirt.

Step 1: Remove the cooling plate from the fan.

Step 2: Get clean water to cool the cooling plate, you can also use a soft bristle brush and scrub to be cleaner. Then wait until it is dry, then put it back into the fan.

2. Clean the water tank of the air conditioner fan

Water containers are parts that help with air conditioning and water storage, so they are more dirty than other parts. If using an air conditioner for a long time without changing the washing regularly, unpleasant odors will appear. Moreover, this will also be a favorable environment for all kinds of bacteria to grow, affecting your family's health. So, you need to empty the water tank and clean the water tank every 3 days. The steps are as follows:

Step 1: Unplug the fan cord from the power plug.

Step 2: Put old water in the bottle.

Step 3: Use a soft cloth to clean the inside of the water tank.

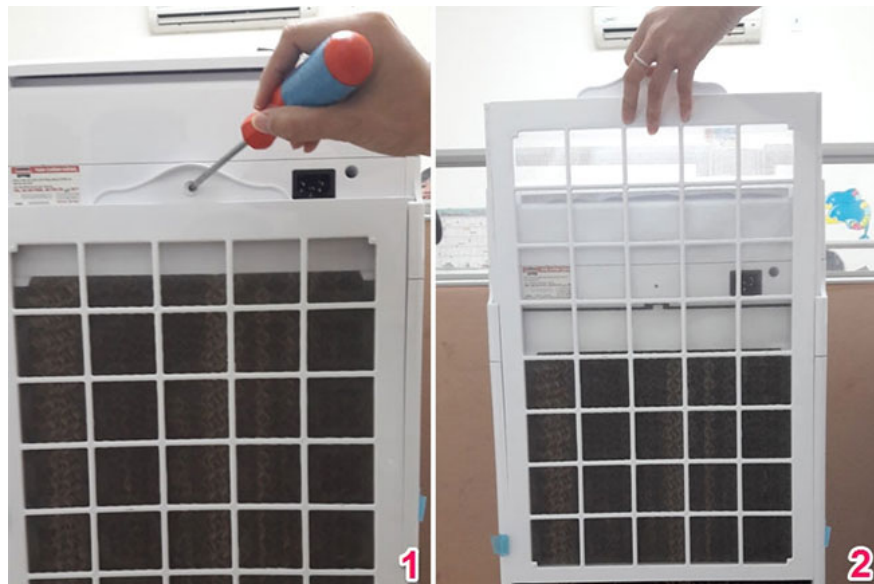

3. Clean the filter of the air conditioner fan

The filter is also one of the parts that need special attention when cleaning air conditioner fan. Typically, the filter is installed at the back and side of the fan (both vertically and horizontally). Cleaning the filter once a month will help the fan run cool and bring a fresher atmosphere.

Step 1: Remove the filter plates.

Step 2: Gently clean with water.

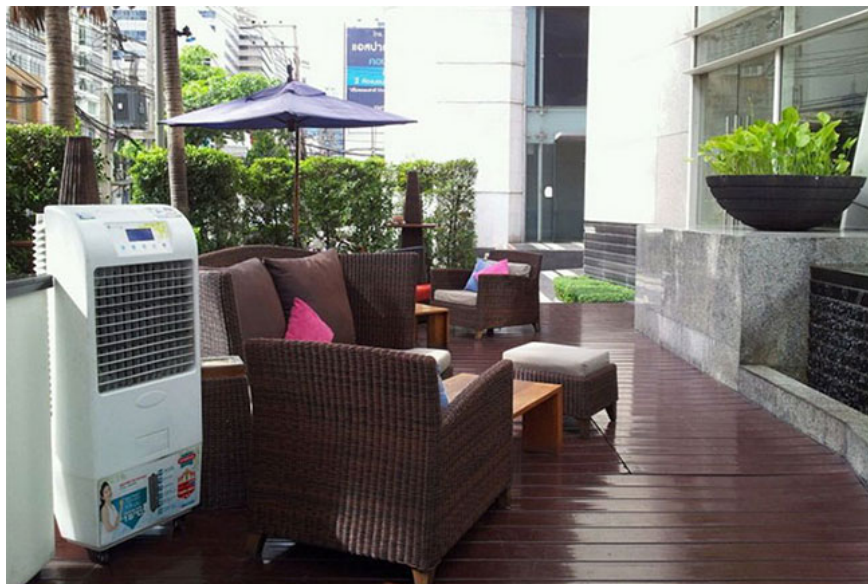

4. Cleaning body, air-conditioning fan

Cleaning the air conditioner fan must not ignore the body, the air-conditioning fan. However, when cleaning these parts, you should only use a damp cloth to clean, absolutely do not use the wash water directly because the fan body contains the control panel and LED display screen. Clean the fan body once a month according to the following actions:

Step 1: Remove all filters to clean the air-cooled impeller (for propeller type).

Step 2: Use a damp cloth to clean your body thoroughly as well as an air-cooled propeller.

Some notes to know during cleaning air conditioner fan:

1. Turn off the device and unplug the power before cleaning the fan.
2. Do not use excessive cleaners while cleaning.
3. Note when cleaning the fan so that it does not leak into the engine causing a fire.
4. After cleaning, dry the parts before reinstalling and using.
