

Instructions for delaying updating Windows 10 Spring Creators Update in 365 days

In the next few weeks, Spring Creators Update (version 1803) will be released. If Windows 10 users do not want to update Windows 10 Spring Creators Update on their device to observe first, then the following guide can be made.

In the next few weeks, Spring Creators Update (version 1803) will be released. If Windows 10 users do not want to update Spring Creators Update on their device to view it first, you can follow the instructions in the article. The maximum update delay is up to 365 days.

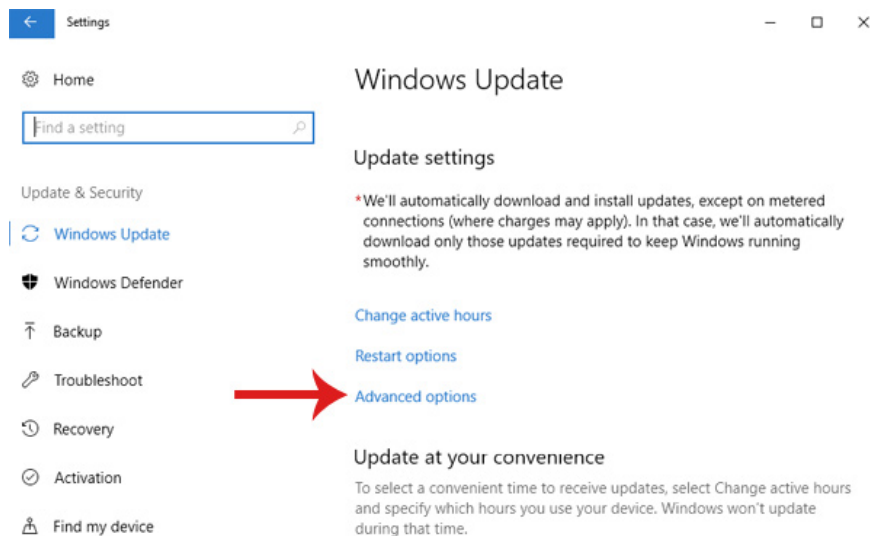

Spring Creators Update is a major update for Windows 10 to improve performance and patch holes. This is the most stable update so users can safely install it after it is widely released.

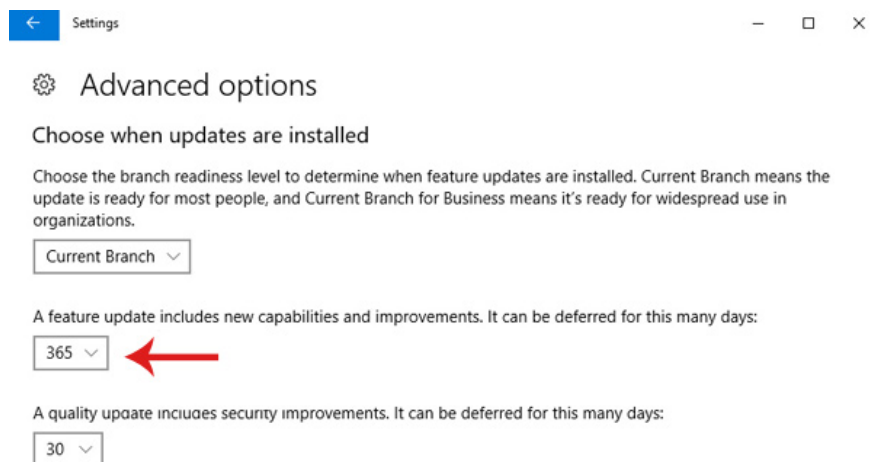

2 ways to help users postpone or lock Windows 10 Spring Creators Update

Method 1:

Step 1: Open the **Settings** app -> select **Update & security** -> select **Windows Update** -> at **Update Settings** select the **Advanced options** link.

Step 2: Scroll to the section **Choose when updates are installed** -> in the option **A feature update includes new capabilities and improvements. You can** choose a number between 1 and 365 corresponding to the time period you want to postpone Windows 10 Spring Creators Update.

Note:

When you want to update Spring Creators Update, you only need to set this value to 0 days.

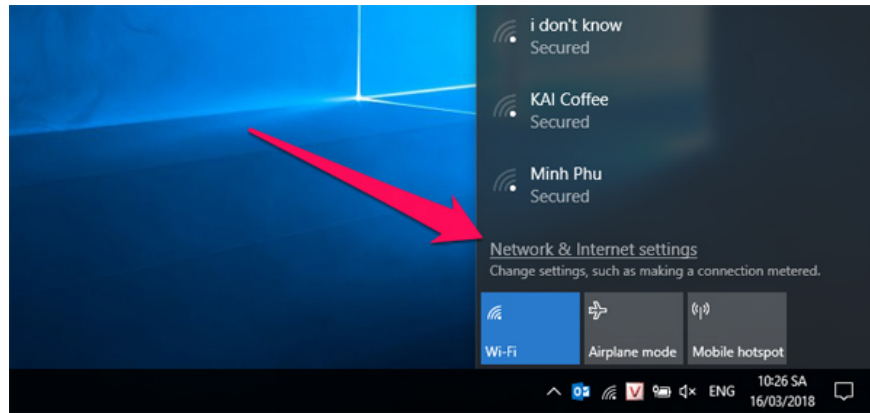

Method 2:

Set the WiFi connection to connect according to traffic

Windows 10 will not download Windows updates through data connections (metered connection). Therefore, to postpone Spring Creators Update, users can choose to set up an Internet connection as a connection. With Windows 10, you can do it easily on both wired (Ethernet) and wireless (WiFi) networks.

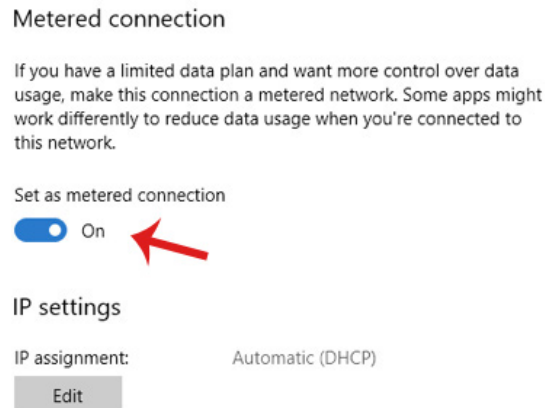

Note: You need to make sure that the Windows 10 computer that is connected to the network you want to set is connected by traffic before doing it this way.

Step 1: Open the **Network and Internet** of the Settings application by clicking on the WiFi icon in the Desktop screen and select **Network Settings** .

Step 2: In **Network and Internet** interface , select WiFi option to see all WiFi network and WiFi network options you are connecting -> select Advanced options or click on WiFi name to open advanced options.

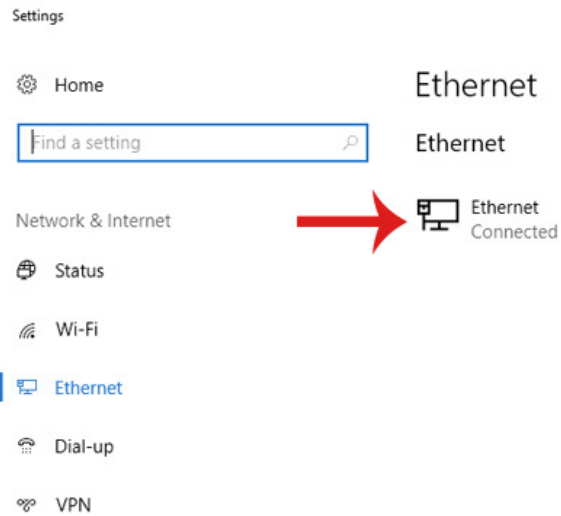

Step 3: At the **Metered connection** -> open the **On** mode at **Set as metered connection** to Windows 10 to see if your WiFi connection is connected by traffic.

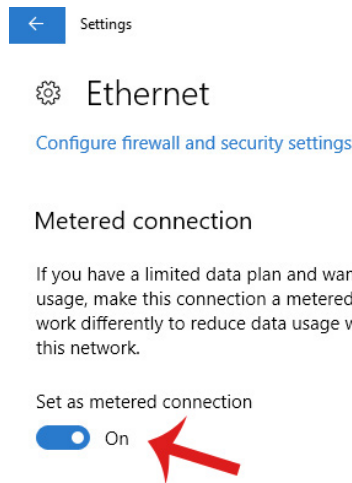

Ethernet connection is a connection based on traffic (applies to Windows 10 Creators Update build 15002 or newer builds).

Step 1: Open **Settings** -> select **Network & Internet** -> select **Ethernet** to see the Ethernet connection settings and related settings.

Step 2: Open its settings and other information such as IP address and MAC address by selecting your current Ethernet connection.

Step 3: At the **Metered connection** -> turn on the **Set as connection metered** option to set your Ethernet connection as a connection.

Note: If you are connected to a WiFi network that is not set to be connected by traffic, Windows 10 may automatically download Spring Creators Update.
