

Instructions for installing WordPress on the Virtual Server with Cloud9

Downloading and running internal WordPress servers is quite complicated. If you are a seasoned developer, you should set up a local server with XAMPP or WAMP. But if you are a 'new' who just wants to 'mischief' install WordPress self-host, follow and follow the steps below.

Downloading and running internal WordPress servers is quite complicated. If you are a seasoned developer, you should set up a local server using XAMPP or WAMP. But if you are a "new ghost" just want to "playfully" install WordPress self-host (different from wordpress.com) to see what a custom WordPress site will look like, but not successful.

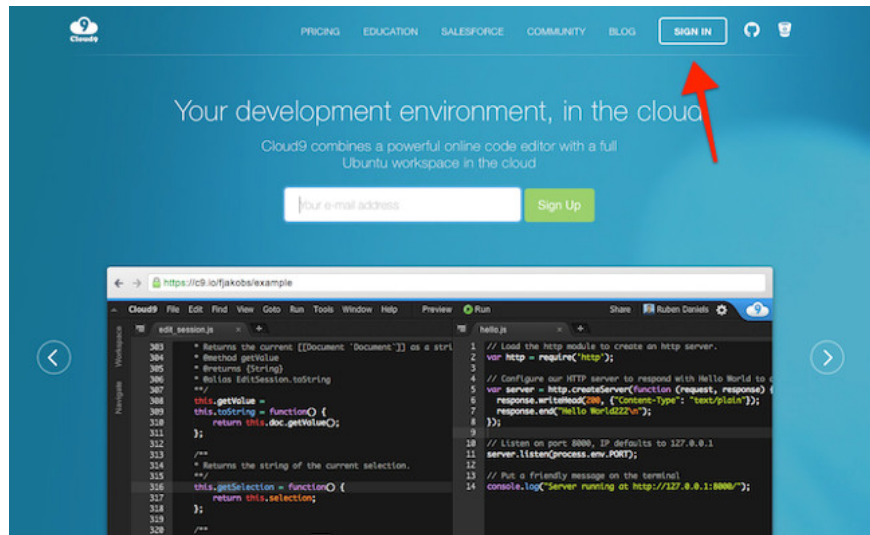

So, I recommend you to skip this tedious process, try installing free WordPress on Cloud9 virtual server without code, without downloading specialized software. With just a few simple steps - theme options and additional plugins - and in a few minutes WordPress has been installed.

What is Cloud9?

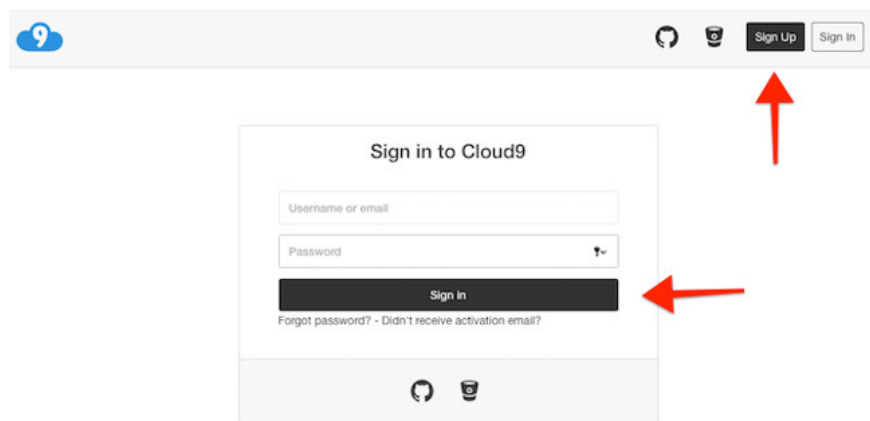

Cloud9 is a cloud-based development environment. It allows encryption on more than 40 languages ??on web hosting servers and creates a free basic workspace. What you need is a CPU, a 512 MB RAM, and a 2 GB hard drive. In addition, install WordPress on the workspace with just one click.

Instructions for installing WordPress on Cloud9

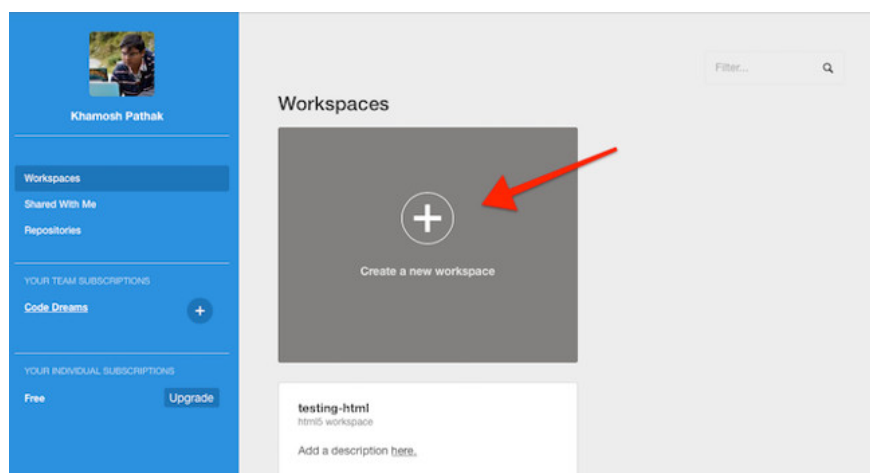

Step 1 : Visit Cloud9 page and click ' **Sign in** ' on the top toolbar.

Step 2 . On the next page, register for an account

Step 3 . After logging in, you will see Workspace, click 'Create a new workspace'

Step 4. Name the Workspace and select the group (if needed). You can leave the workspace in ' **Private** ' mode (for free, you can only do this once). Now, select the template, click on WordPress and select ' **Create Workspace** '.

Create a new workspace

Workspace name: tests | Description: Make a short description of your workspace

Team: Code Dreams

Hosted workspace | Clone workspace | Remote SSH workspace | Salesforce

Private (This is a workspace for your eyes only) | Public (This will create a workspace for everybody to see)

Clone from Git or Mercurial URL (optional): e.g. ajaxorg/ace or git@github.com:ajaxorg/ace.git

Choose a template:

- HTML5
- Node.js
- PHP Apache ...
- Python
- Django
- Ruby
- C++
- Wordpress
- Rails Tutorial
- Blank
- Harvard's CS50

Create workspace

Step 5. Wait while Cloud9 set up the virtual server for you.

Create a new workspace

Workspace name: tests | Description: Make a short description of your workspace

Team: Don't set a team for this workspace

Hosted workspace | Clone workspace | Remote SSH workspace | Salesforce

Private | Public

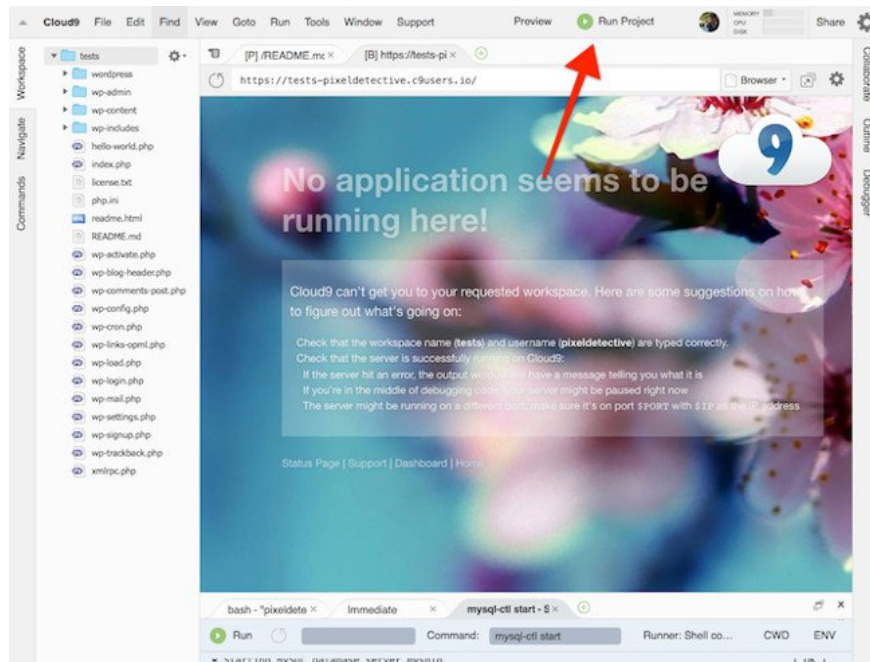

Creating your workspace...

Clone from Git or Mercurial URL (optional): e.g. ajaxorg/ace or git@github.com:ajaxorg/ace.git

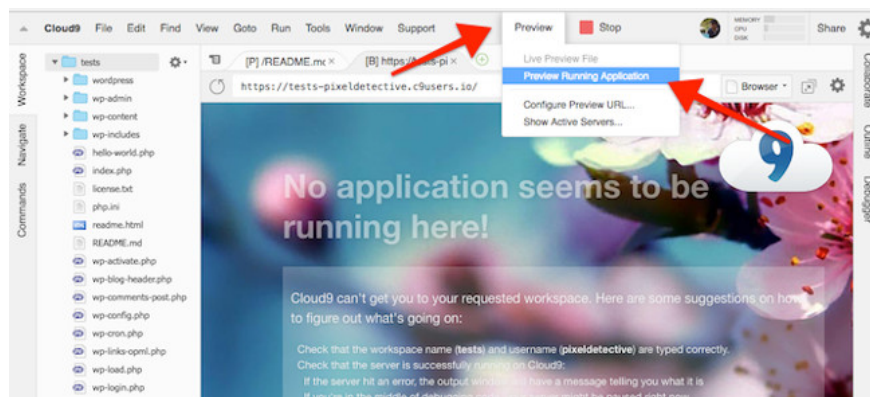

Choose a template:

- HTML5
- Node.js
- PHP Apache ...
- Python
- Django
- Ruby
- C++
- Wordpress
- Rails Tutorial
- Blank
- Harvard's CS50

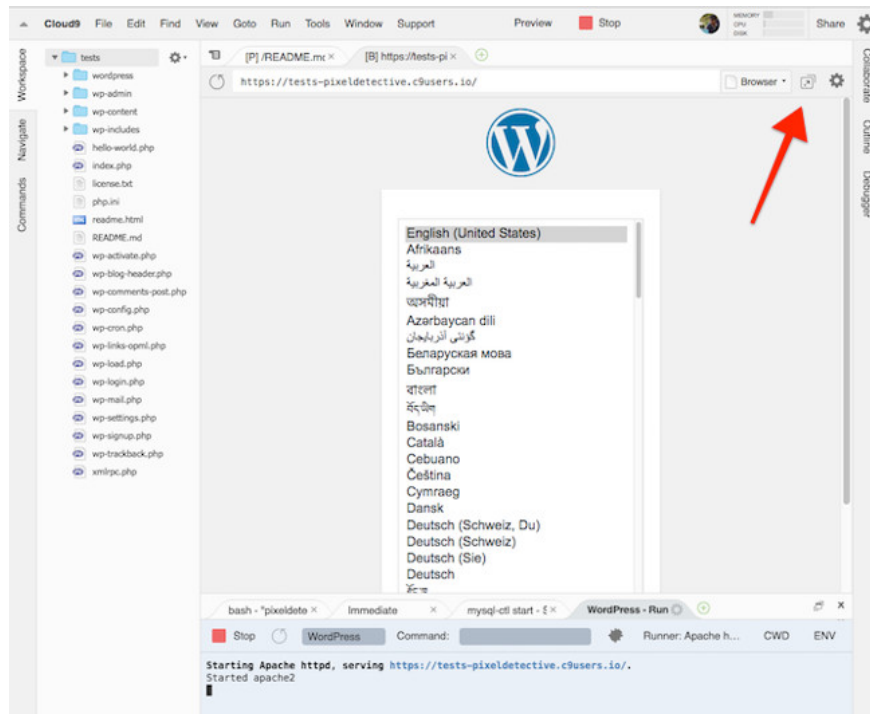

Step 6. Now that you are placed in the IDE and you can skip all the code, just click ' **Run Project** ' on the top toolbar.

Step 7. The server is running, select 'Preview' and then select 'Preview Running Application'.

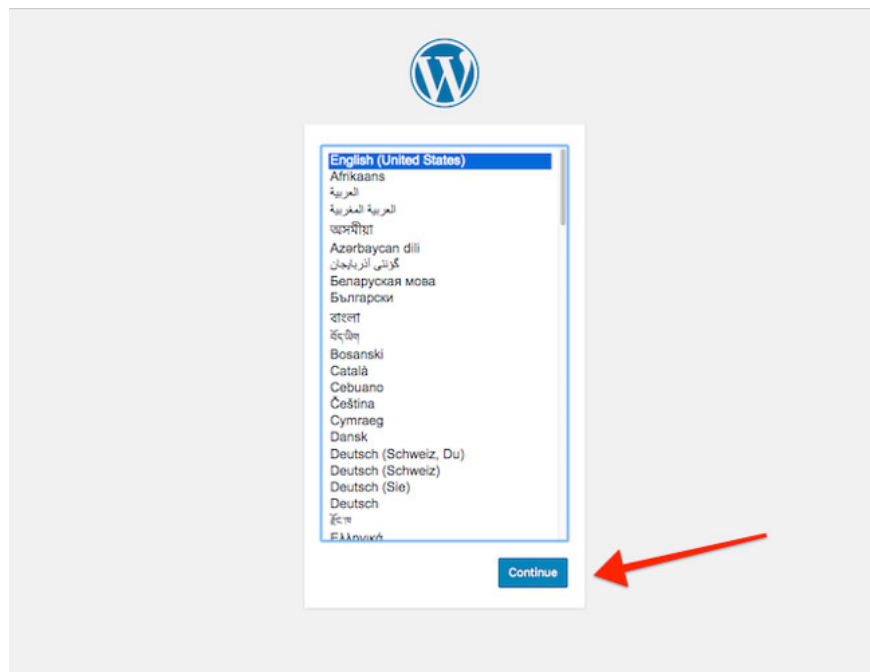

Step 8. The WordPress installer is running in the IDE. You can see the installation screen here. For easy tracking, open the setup screen in a completely new tab by clicking 'Pop Out into New Window' marked as the screenshot below.
