

# Instructions for quickly opening Windows applications using the Run command

When you need to quickly open an application in Windows, we often use keyboard shortcuts. However, few people know that there is still another way, that is to use the Run command. There are many commands in Run to open different applications in Windows but the most common are 5 commands to open the following applications. Please consult.

When you need to quickly open an application in Windows, we often use keyboard shortcuts. However, few people know that there is still another way, that is to use the Run command. There are many commands in Run to open different applications in Windows but the most common are 5 commands to open the following applications. Please consult.

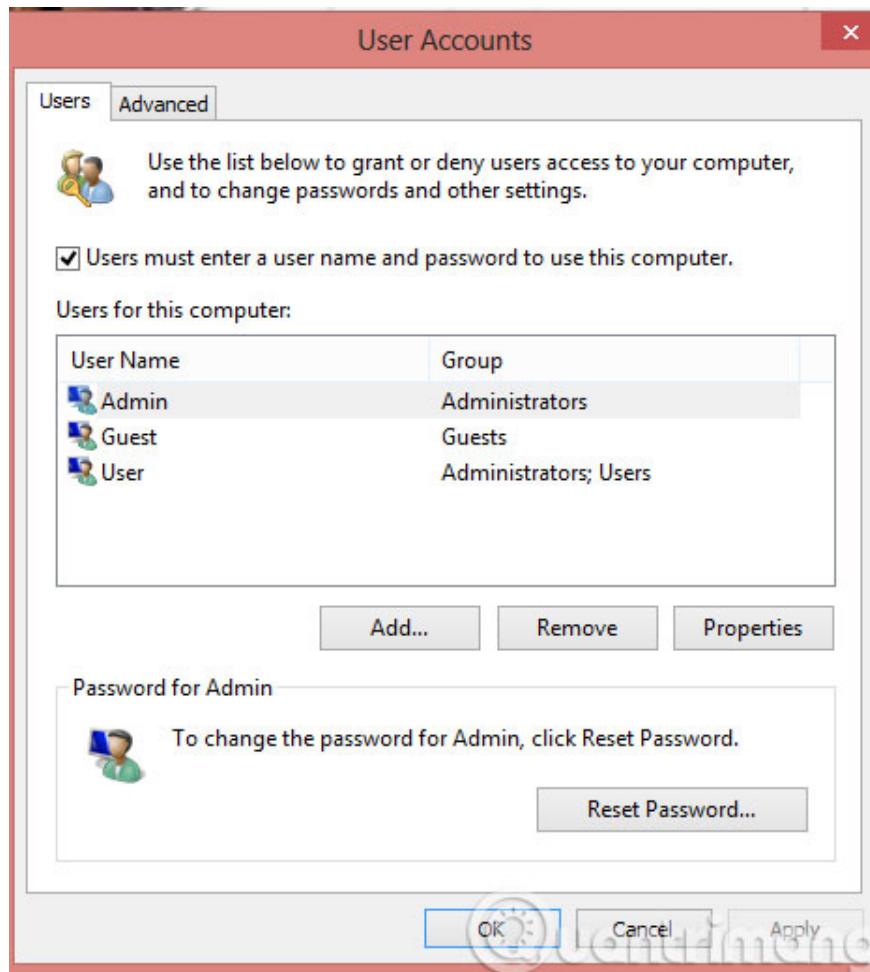

## 1. Open the Shared Folders folder quickly

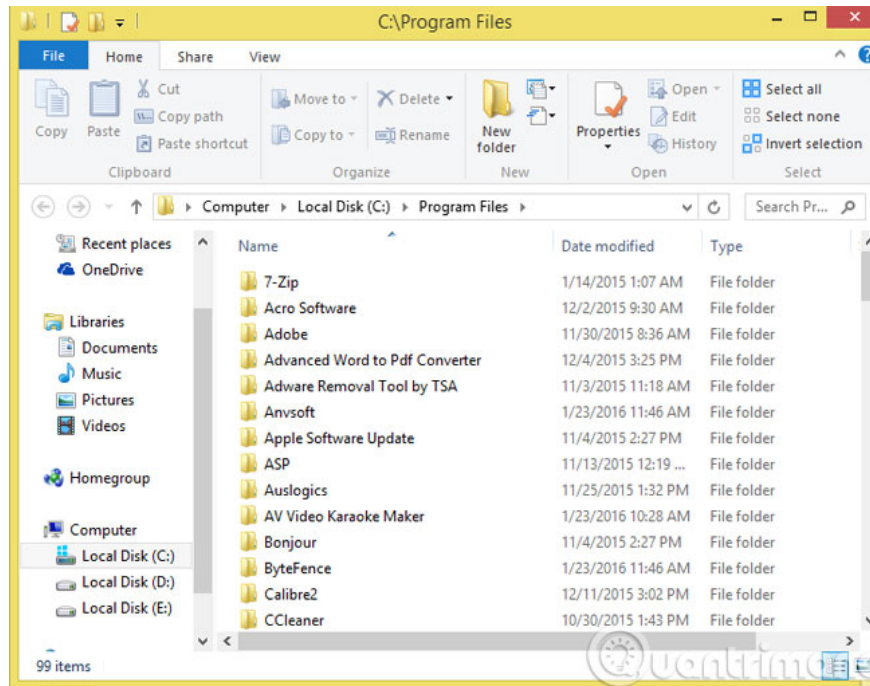

When you need to open the **Shared Folders** folder shared between computers on the local network, just type **fsmgmt.msc** in the Run dialog box.

## 2. Quickly open User Accounts

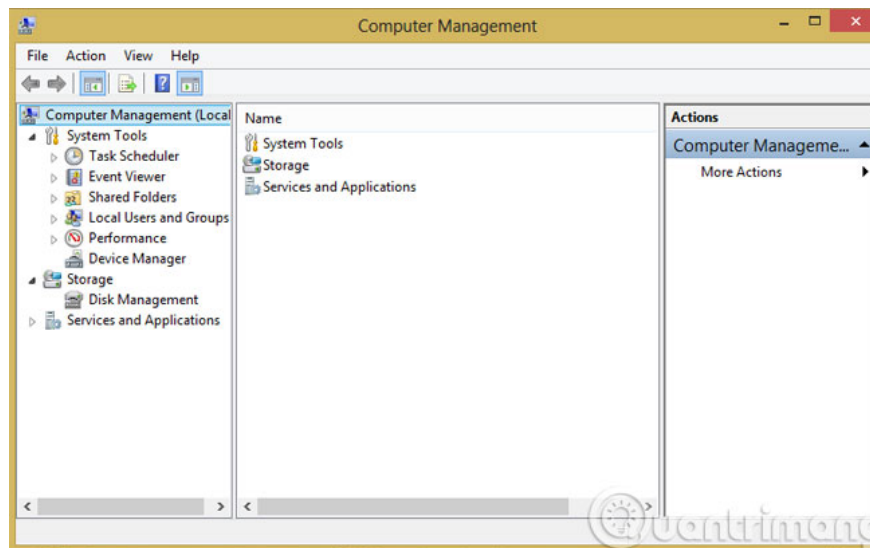

With **User Accounts** , admin can manage other accounts in Windows. To quickly open **User Accounts** , enter **netplwiz** in Run.

### 3. Quickly open Program Files

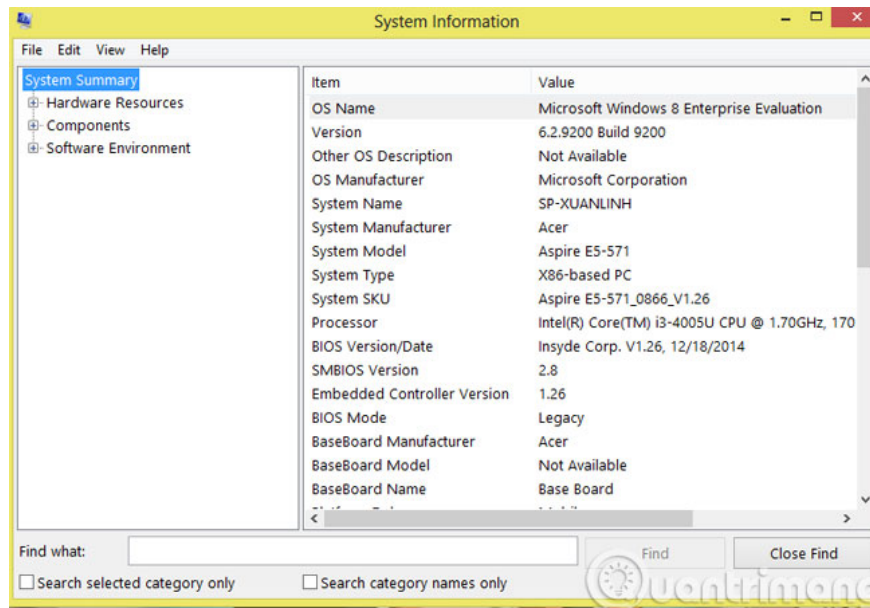

Normally, to open **Program Files** , we still go to drive **C** (the default) in **Computer** but there is another way faster, that is to type **% programfiles%** in the Run dialog box.

### 4. Quickly open Computer Management

When you need to interfere with the driver on the computer, we will open **Computer Management** , there is a very fast way, enter **compmgmt.msc** into Run.

## 5. Quickly open System Information

This is where we can capture all the information about the computer we are using, both hardware and software. To quickly open **System Information** , type **msinfo32** in Run.
