

Instructions for syncing Chrome data on multiple devices

If you switch between different devices or computers, you must be very upset when your browser data is locked while transferring the device. However, if you use Chrome, you can use the synchronous system that Google has included in their web browser. Let's see how to synchronize Chrome data between multiple devices!

If you switch between different devices or computers, you must be very upset when your browser data is locked while transferring the device. However, if you use Chrome, you can use the synchronous system that Google has included in their web browser. With this sync setting, you can download all browsing data on other devices that also use Chrome. This allows you to access all your bookmarks, passwords and browsing history on any device you are using.

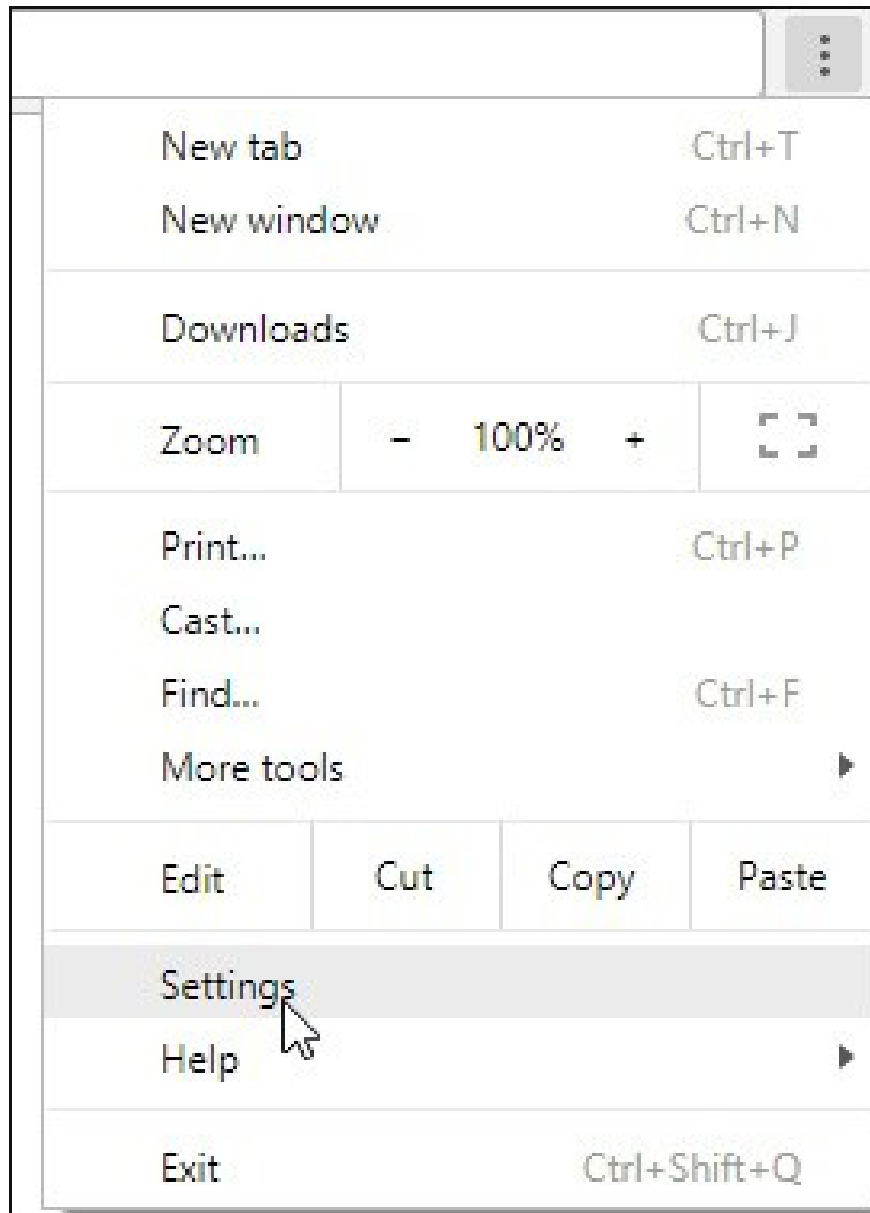

Let's see how to sync Chrome data between multiple devices!

Steps to sync Chrome data

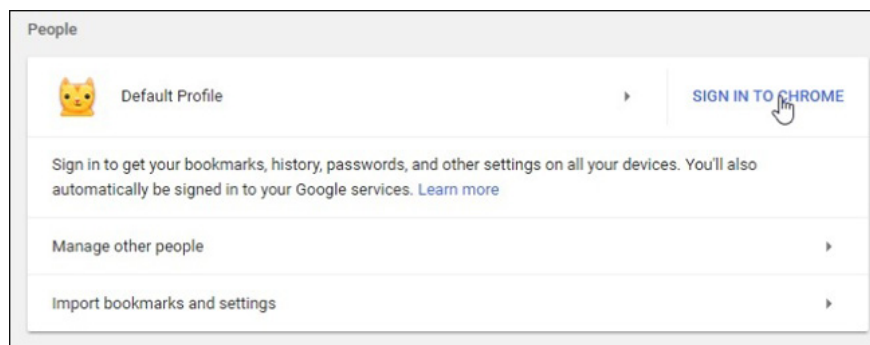

Step 1: Log in to Chrome

Of course, if you want Chrome to synchronize data between the two devices, we have to tell it that we're browsing the web. To do this, we need to attach a Google account to Chrome that makes it sync data according to that account. Then, when we want to access this data from another Chrome browser, we also log in to the Google account there. This allows Chrome to synchronize data with another device.

To set up synchronization, open a Chrome window if it's not already running. Looking at the top right of the Chrome window, you will see a button like 3 vertical dots or 3 horizontal bars overlapping. Click it, then click **Settings / Settings**.

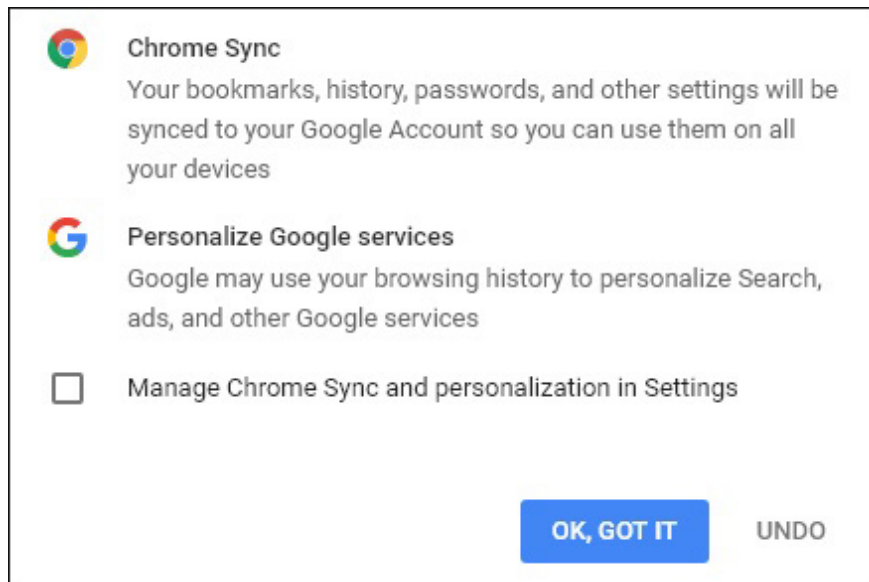

At the top of the window is the People list. Below is the **Sign in to Chrome option / Sign in to Chrome** . Click this option and you will be prompted to enter your Google credentials. The account you use must be a Google account, so make sure you log in correctly.

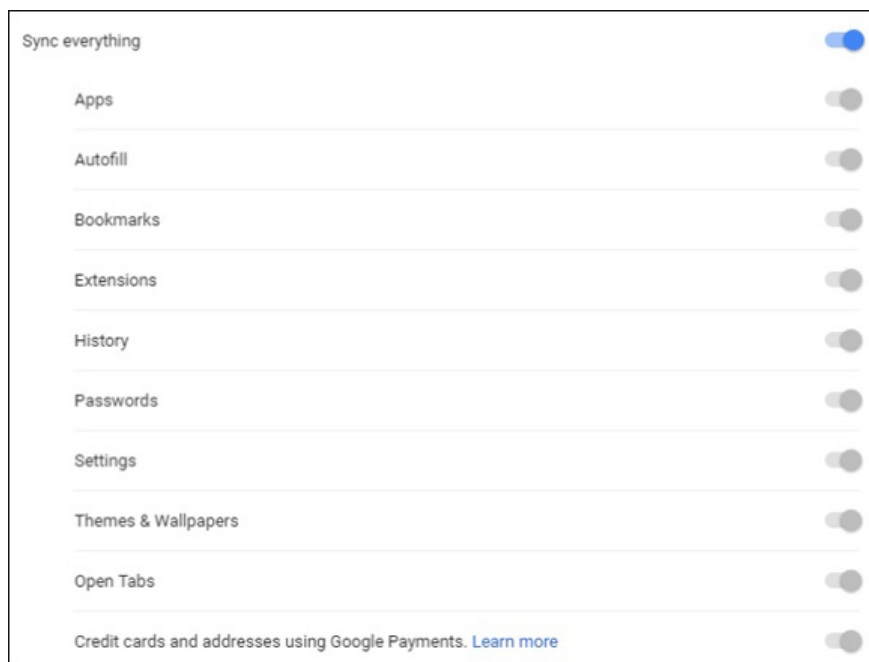

Step 2: Chrome sync settings

Chrome will let users know what it will do, including synchronizing all the data with the server and personalizing the ads as you like. If you agree with these, click **OK, got it** and activate sync. If you want to customize Google sync, check the **Manage Chrome Sync and personalization in Settings** box before clicking "OK, got it". If you don't want Google to sync your data anymore, press **Undo**.

If you chose to sync but then change your mind, you can go to **Settings** and click **Sync** in your account to edit the synced content.

When you click Sync in Settings, you will see a window like the one below.

Turn off **Sync everything** at the top to unlock other options. Now you can freely turn on or off the options that you find reasonable.

Once you've set up sync to your liking, Chrome will automatically synchronize data with its servers. Upload your data before trying to access data from another device!

Step 3: Use synchronization on other devices

The question is, after syncing your Chrome data, how do I get that data on another device?

That is extremely simple. On another device, open Chrome and log in to the Google account that is logged in step 1. Then turn on the synchronization feature. When finished, Chrome will recognize that you are using a new browser and you will receive all the data that you synced before.

You see, now you can access data from any Chrome browser on any device. Very simple, right.
