

Instructions on how to enable Night Mode on Android Nougat

If there is f.lux application on the computer or on an iOS device, there is Night Shift feature to reduce screen brightness and protect the user's eyes. Now on Android 7.0 Nougat device, Google has integrated into Night Mode to help users feel better when using Android phones at night.

If there is f.lux application on the computer or on an iOS device, there is Night Shift feature to reduce screen brightness and protect the user's eyes. Now on Android 7.0 Nougat device, Google has integrated into Night Mode to help users feel better when using Android phones at night.

However, this feature is hidden, so if you want to use it you must enable this feature.

1. Activate the hidden Night Mode on Android Nougat

To enable Night Mode hidden on Android Nougat, follow the steps below:

The first task you need to do is activate System UI Tuner on your Android Nougat device. If you have enabled System UI Tuner, you can skip this step.

To activate System UI Tuner, swipe the screen from the top down twice to open the Quick Settings Menu.

Here you press and hold on the serrated icon for a few seconds and then release it. You should now see the wrench icon appear next to the jagged icon to confirm that the UI Tuner is enabled.

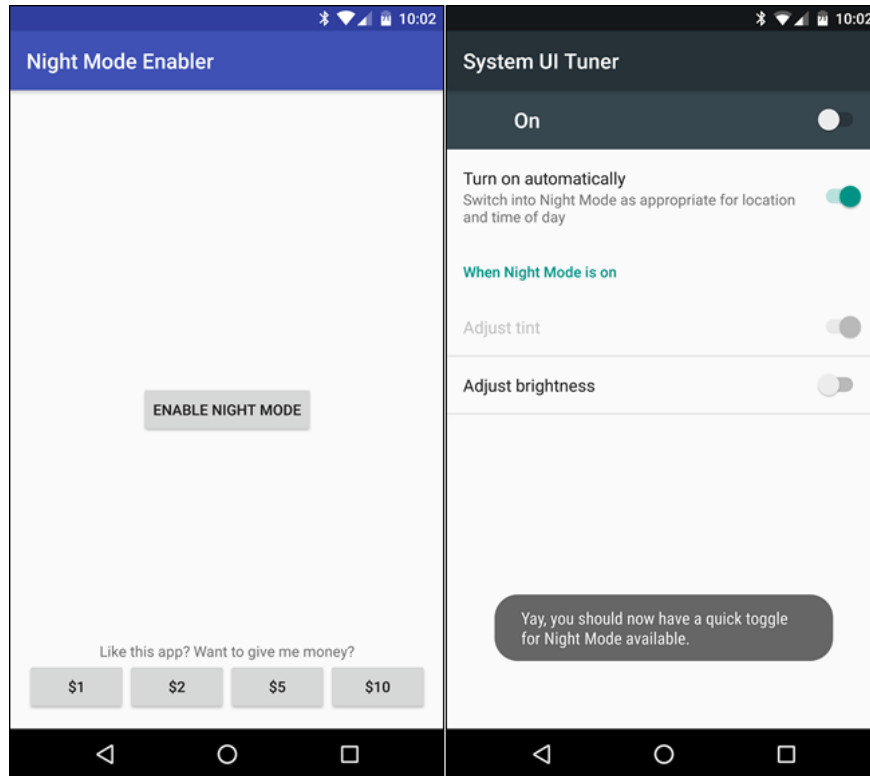

UI Tuner has been activated, your next task is to download and install the Night Mode Enabler application on Google Play Store.

Download Night Mode Enabler to your device and install it here.

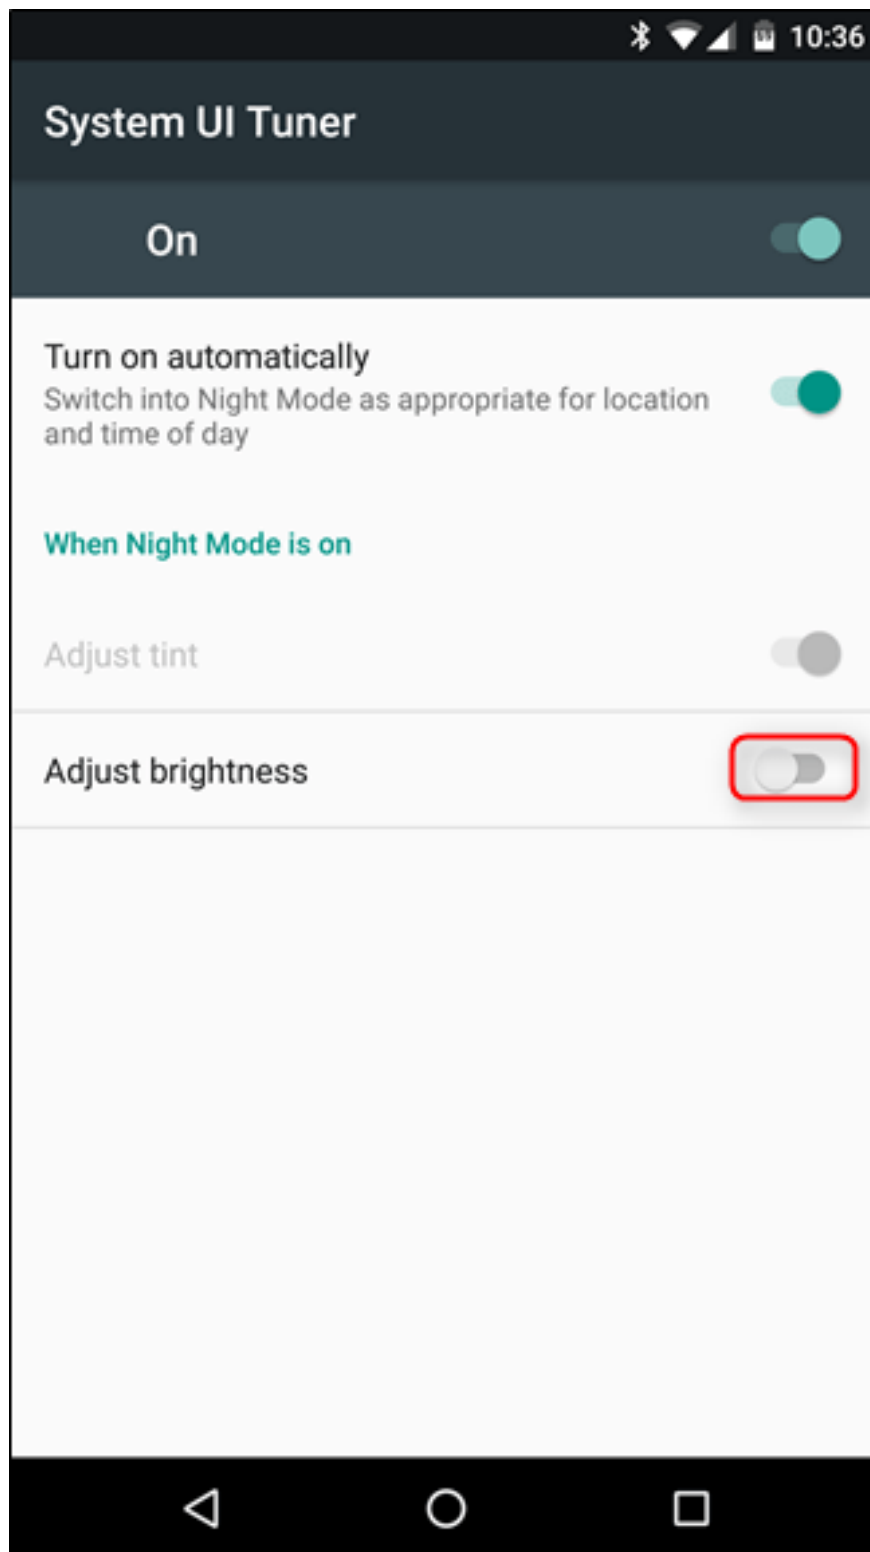

After downloading the application, open the application and click **Enable Night Mode** button. The application will automatically open a new Menu with System UI Tuner and display the message *"Yay, you should now have*

a quick toggle for Night Mode available" on the screen. You can now close the message.

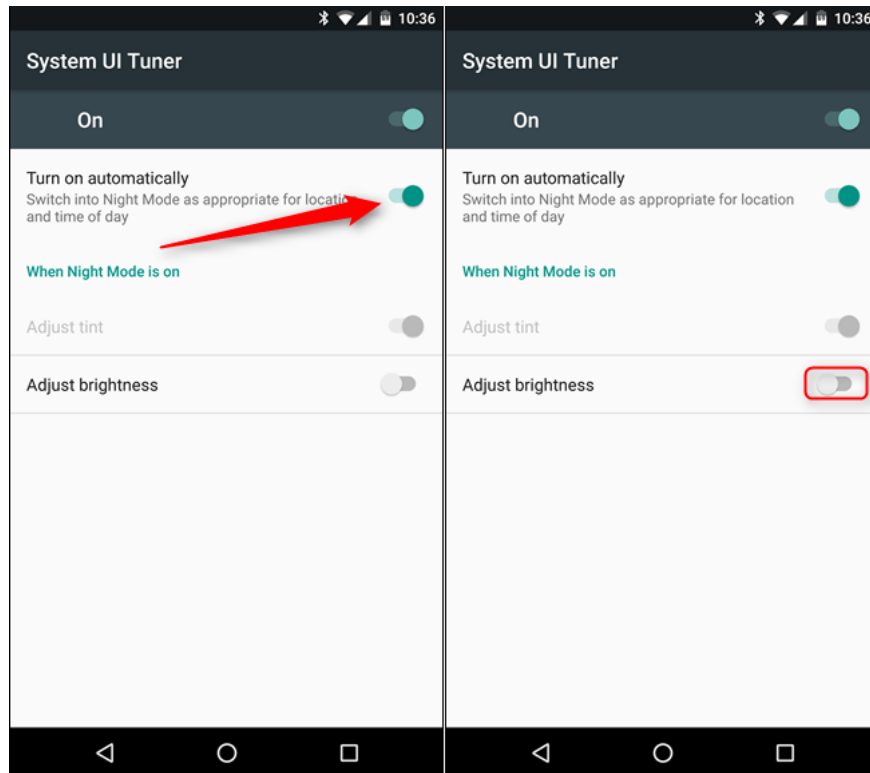

Before adding toggle, you can open Night Mode to see everything about Night Mode. Click the **ON** button in the top left corner, not the toggle button on the right. The screen will immediately turn yellow.

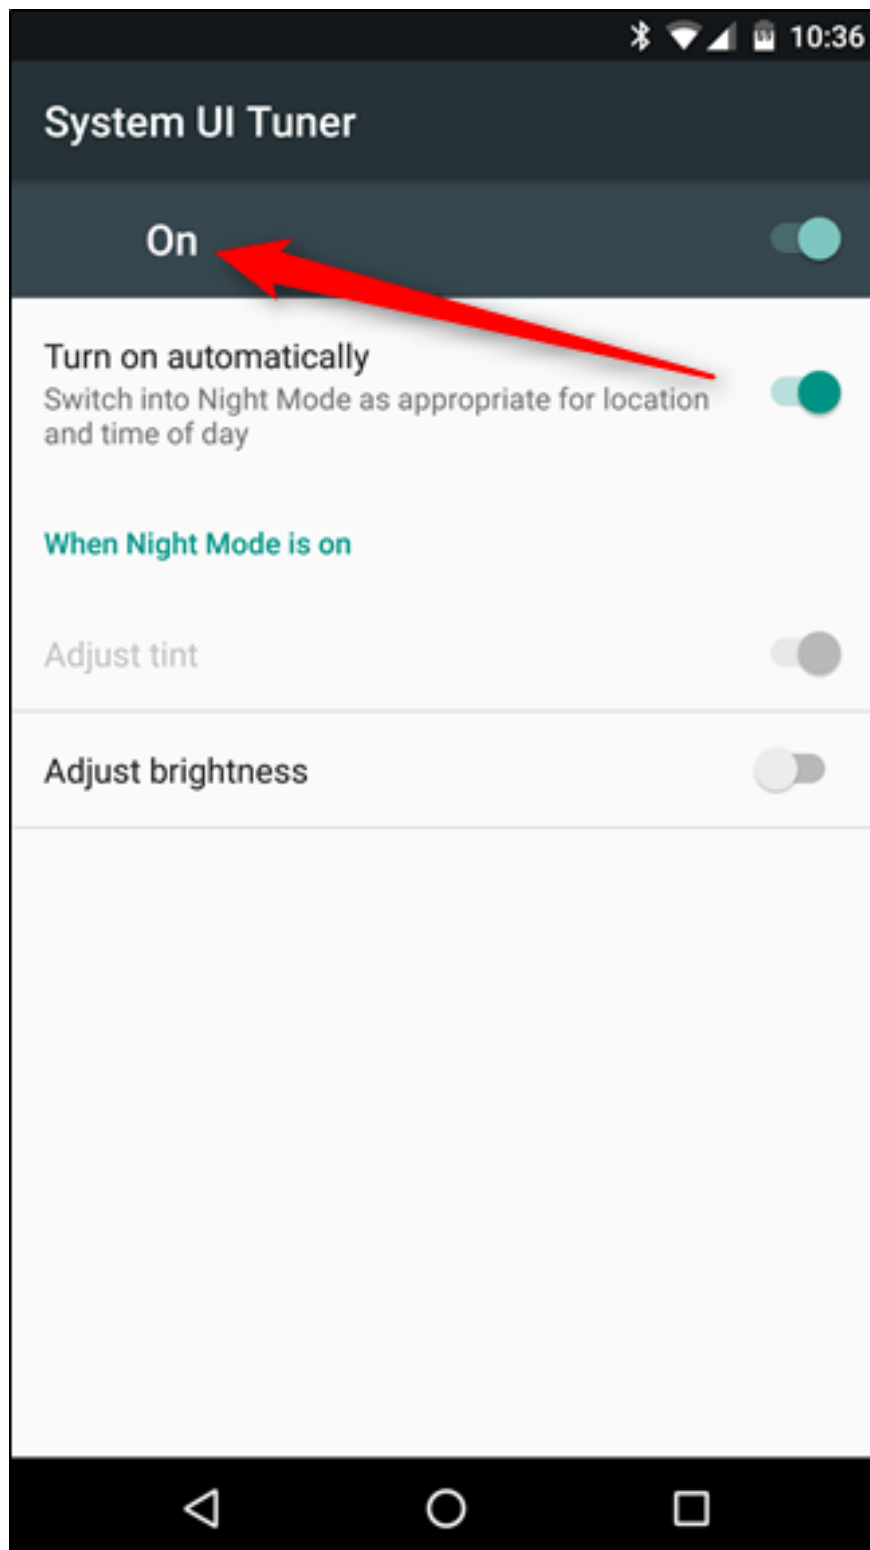

However, to use Night Mode more effectively, you can switch the option status **Turn on automatically** to ON or OFF.

Also you can use Night Mode to set screen brightness. Just switch the **Adjust brightness** option to finish.

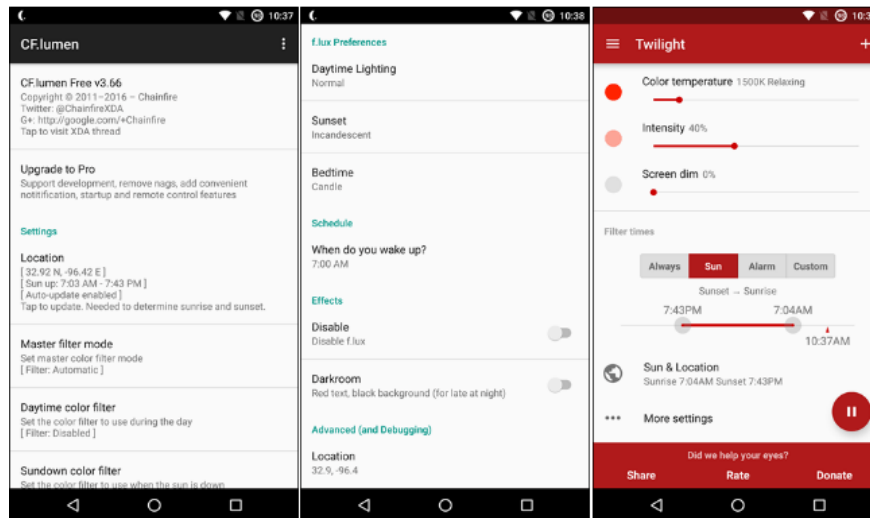

If you want to add the toggle button to Night Mode to the Quick Settings Menu, just follow the instructions and drag toggle Night Mode into it.

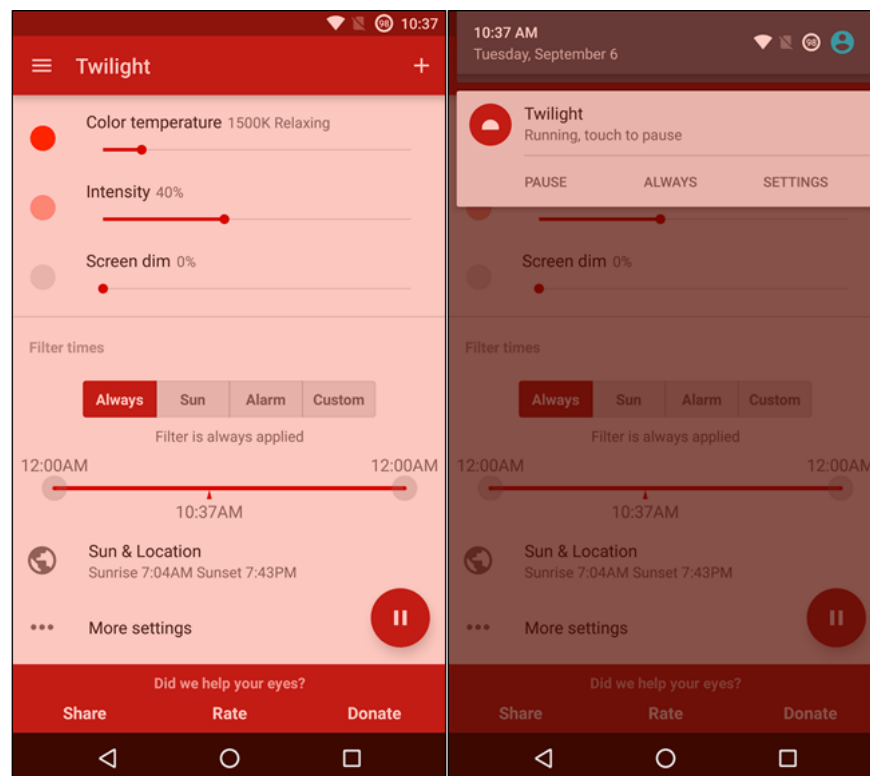

2. Activate Night Mode for Android devices other than Nougat

If the Android device you are using is not Android Nougat, you can still activate Night Mode by using the apps available on Google Play Store such as: CF.lumen, f.lux, or Twilight .

However, it should be noted that both CF.lumen and f.lux require that the device is rooted and Twilight is not required.
