

# Instructions on how to safely remove the USB from the computer, disconnect the USB with the computer properly

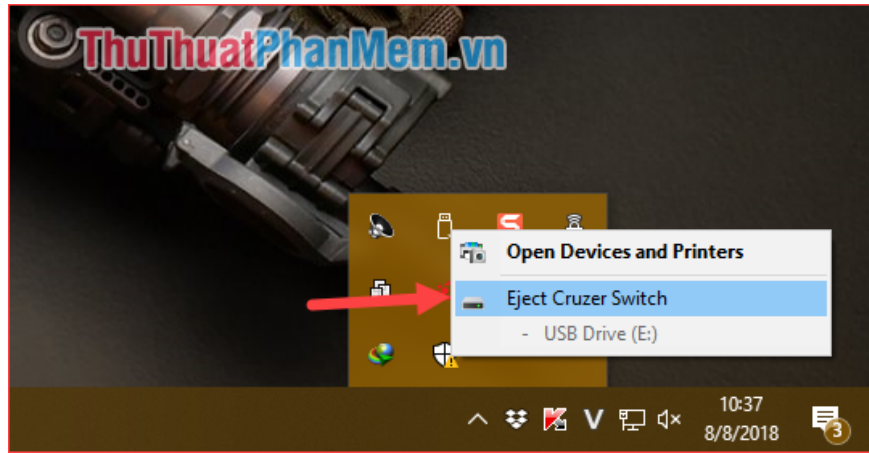

Instructions on how to safely remove the USB from the computer, disconnect the USB with the computer properly. Not everyone knows how to use USB correctly when disconnecting it from a computer. Most people disconnect the USB from the computer, so always unplug it without knowing it

As you know most of us own a computer, it is indispensable for a USB, because the USB will help you copy data from your computer to another computer and vice versa. However, not everyone knows how to use USB properly when disconnecting it from a computer. Most people disconnect the USB from the computer and always unplug it without knowing that your USB device can be corrupted at any time or even the internal data. Therefore, in this article, TipsMake.com will guide you how to safely disconnect the USB from the computer and follow the procedure.

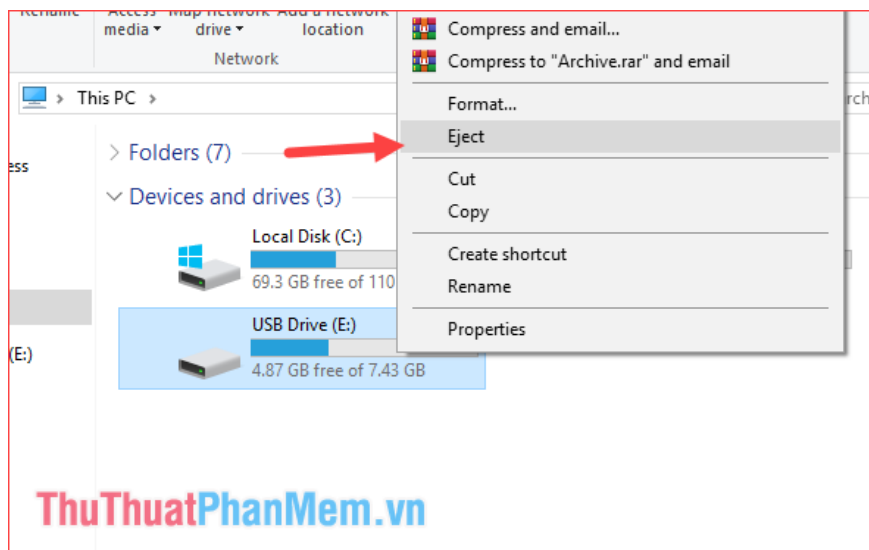

To disconnect the USB from the computer we can use a number of ways such as installing additional USB disconnection software or using the built-in USB disconnection feature in windows. However, using the built-in feature of windows is more than enough and safe, this feature has been available since Windows XP and Windows 10 today.

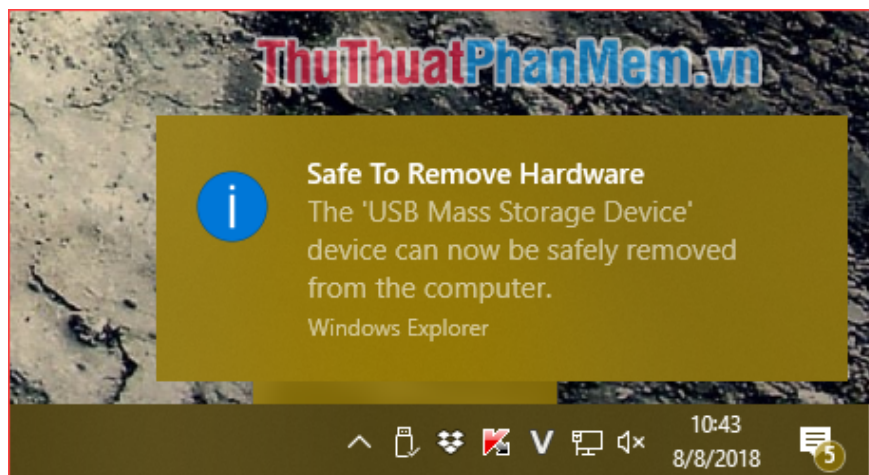

Usage is very simple, right-click on the USB icon on the Taskbar and select **Eject *the device name***.

Or in **My Computer**, right-click on the USB drive and select **Eject**

When notice **Safe To Remove Hardware** as shown below is that you can safely remove the USB.

Just a simple operation like that also helps protect your USB safely and not be afraid of data corruption so remember to do it every time you disconnect the USB from the computer. Thank you for watching.
