The machine is infected with Wanna Crypt Ransomware, how to remove them

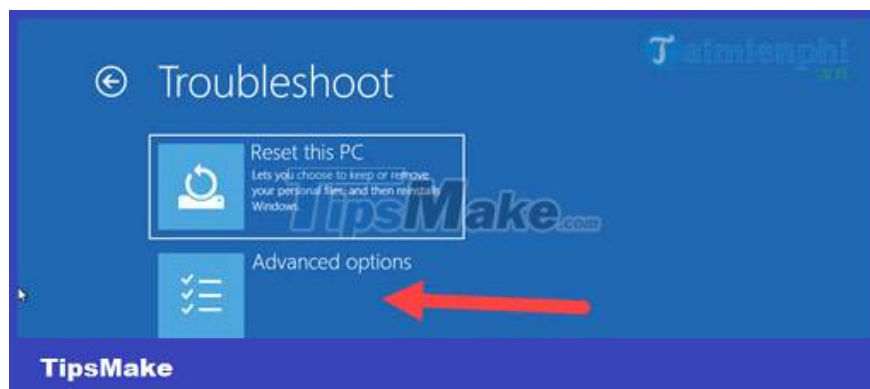

In fact, there is no specific way to remove WannaCry from your computer 100%, but you can also reduce its components in the system by the following:

Step 1: First to remove WannaCry Ransomware from your computer, you need to know to **enter Safe Mode on Windows 10** by restarting the computer and on the running screen **press F8** (this applies to all versions) or hold **Shift and then click Restart** on the computer.

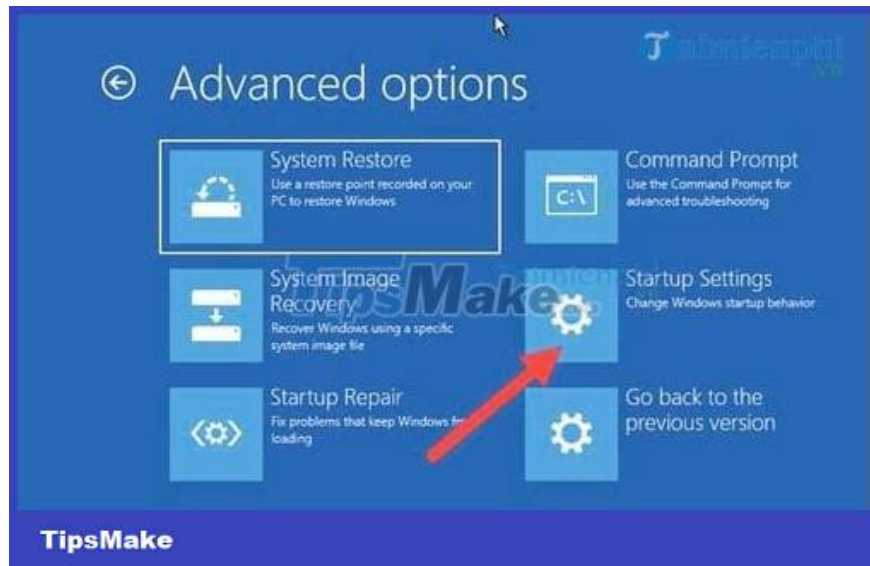

Step 2: On the startup interface, select **Troubleshoot** .

Step 3: Next select **Advanced Options** .

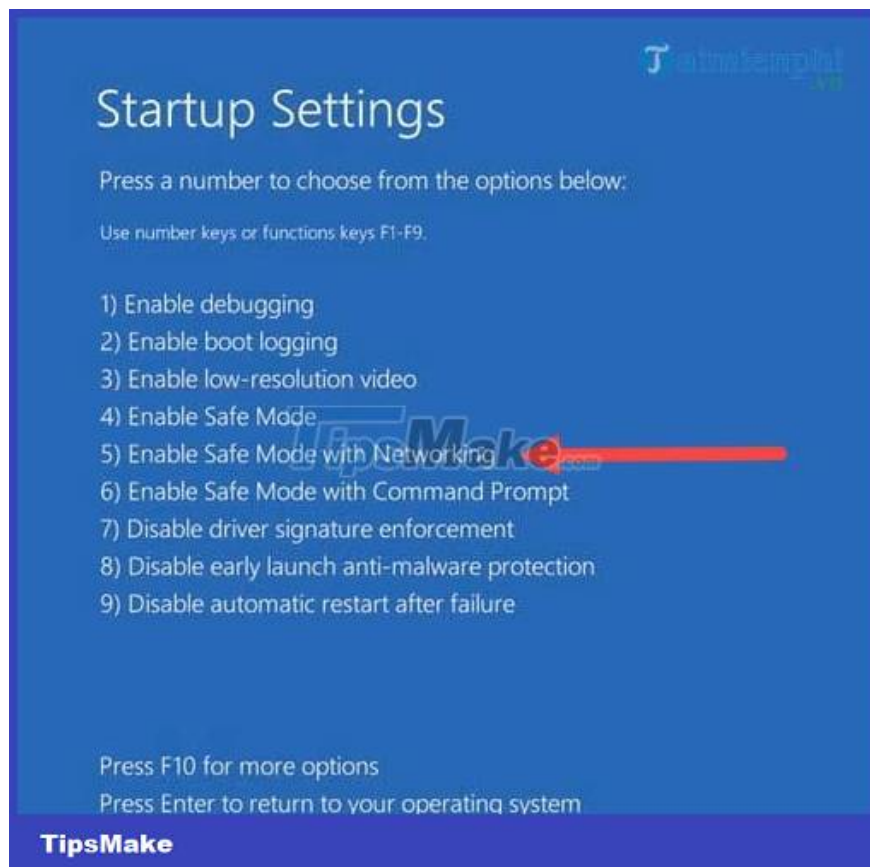

Step 4: In **Advanced Options** mode , click **Startup Settings** to proceed to Safe Mode.

Step 5: Click **Restart** to restart the computer, enter Safe Mode to get A Corrupt User Profile error on Windows 10.

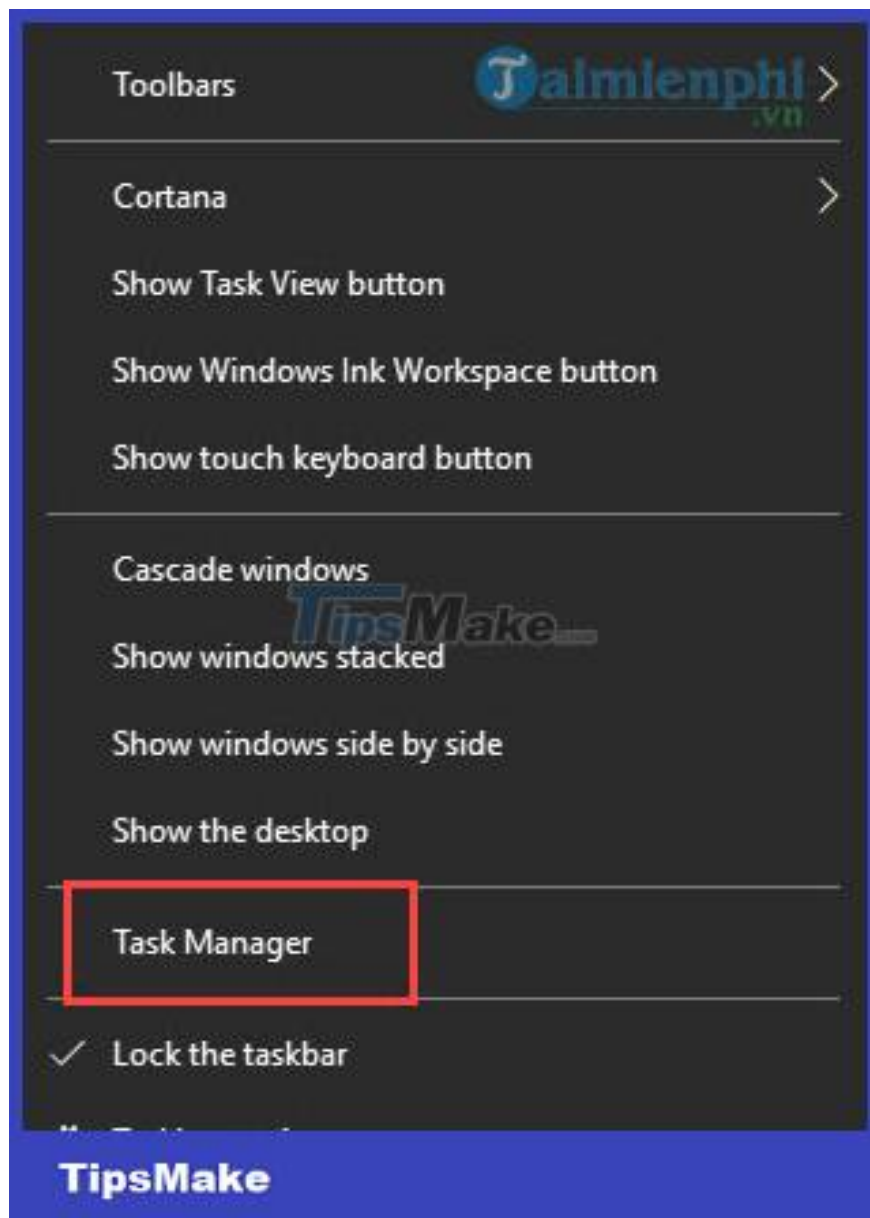

Step 6: The Windows screen will let you choose a lot of modes in Safe Mode, press **F5** to select **Enable Safe Mode with Networking** .

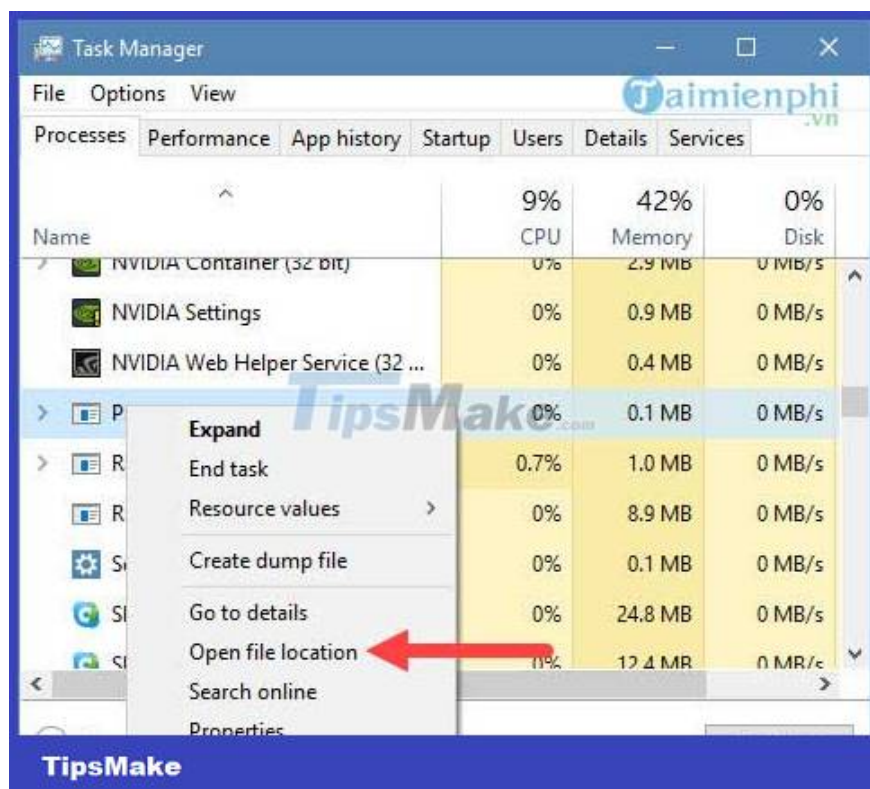

Step 7: You will immediately enter the Windows 10 login screen in **Safe Mode** .

Step 8: Right-click on the Taskbar **and** select **Task Manager** .

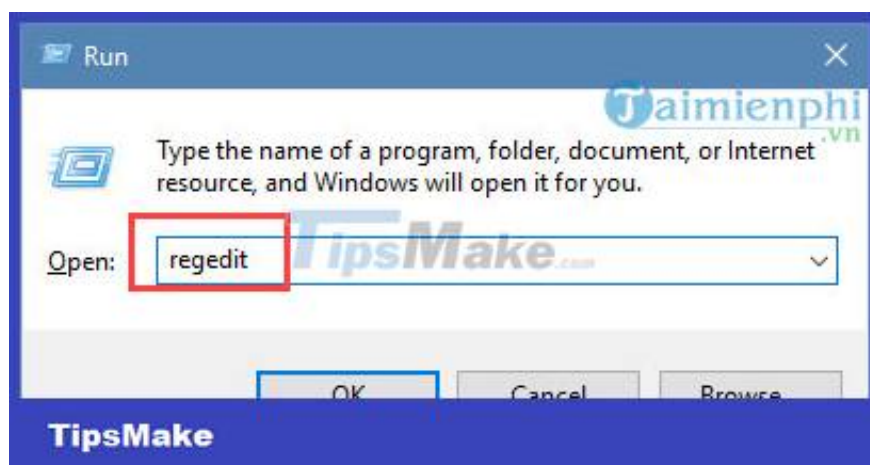

Step 9: Here you pay attention to strange files, processes have very strange names, if you see any such, right click on it and select Open **file location** to proceed to delete it, it is most likely related to the WannaCry virus.

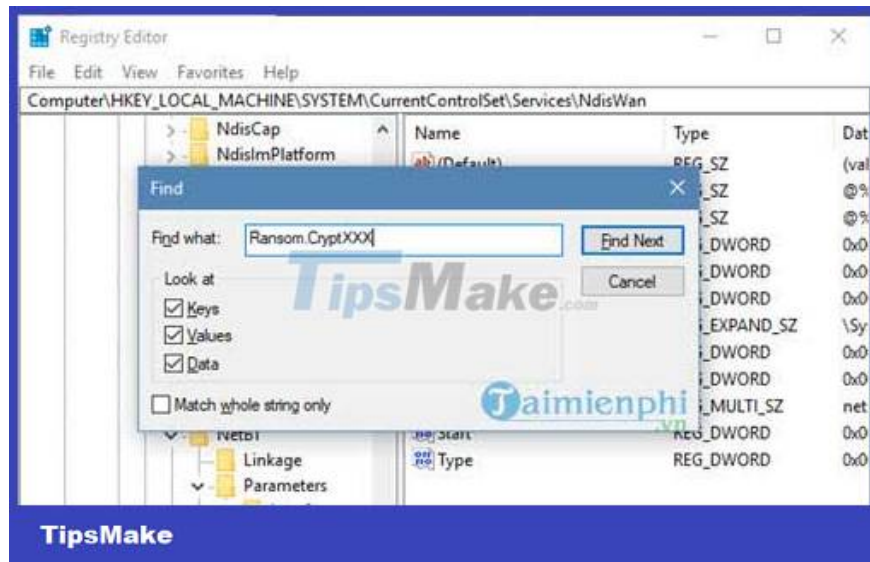

Tip: Look for unusual **CPU** and **Memory** consuming processes , especially CPU.

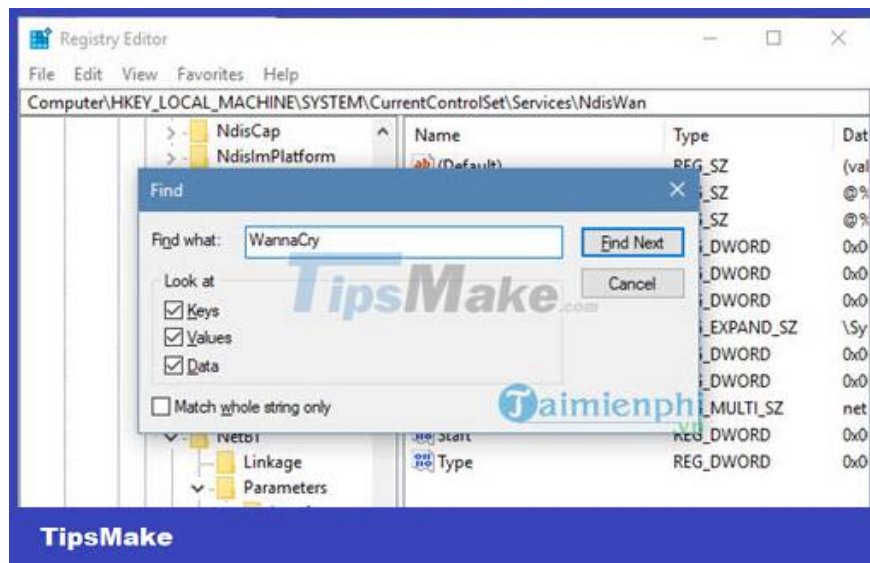

Step 10: Next, press the **Windows + R** key combination , clear Regedit and click OK to access the Registry Editor.

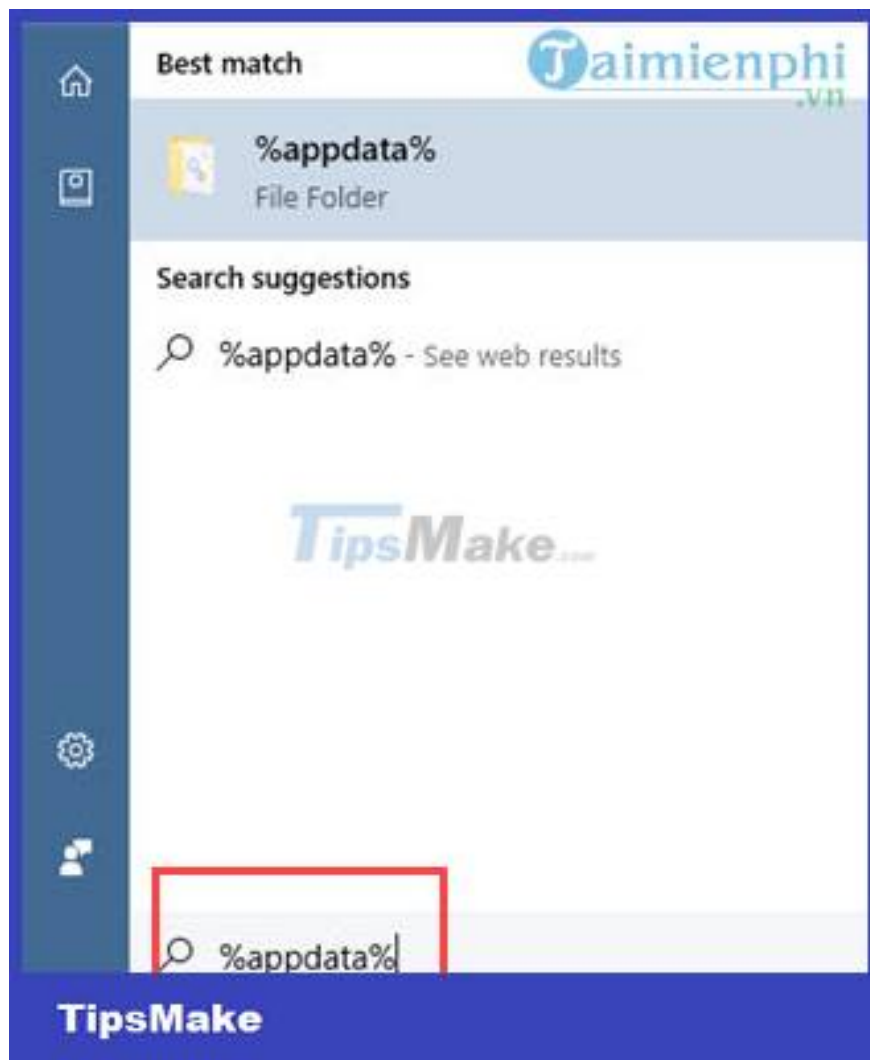

- **In Registry Editor** you press **Windows + R** key combination and type " **Ransom.CryptXXX** " to search for related files, if you find any, delete that file.

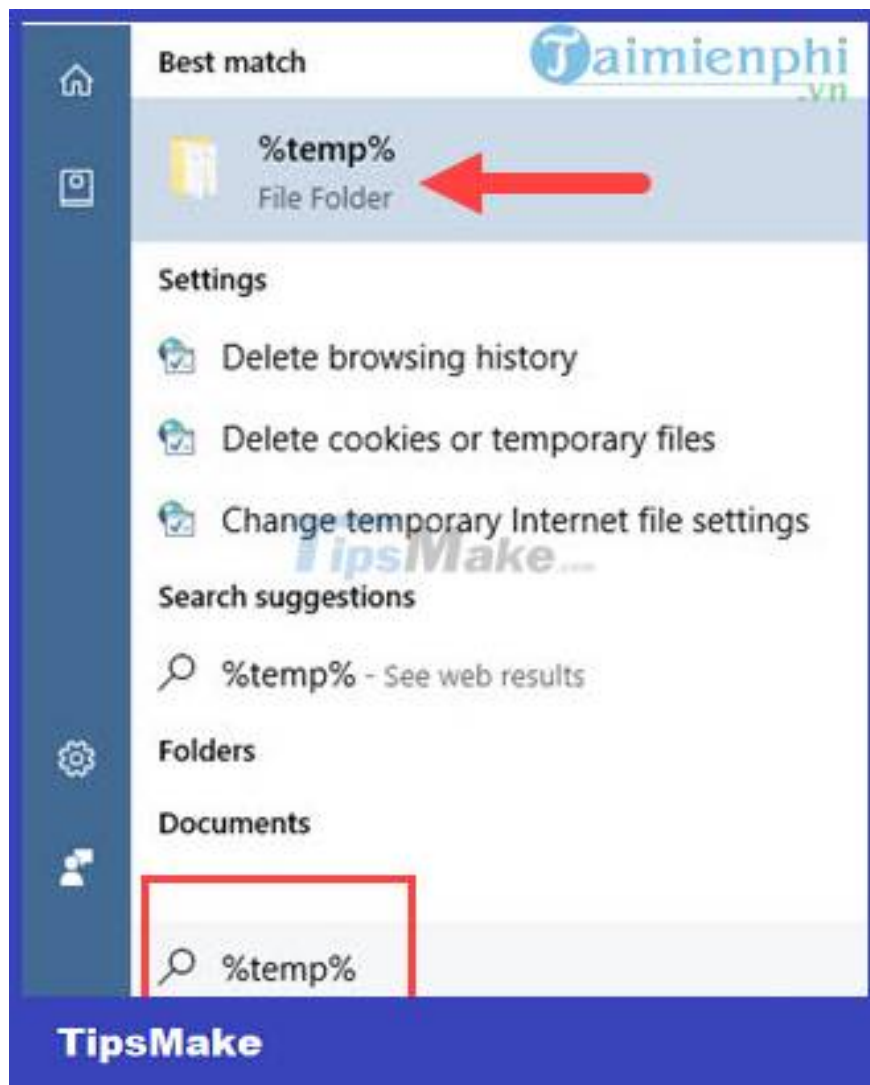

- Similar to the **WannaCry** file , you proceed to find and delete the wannacry malware.

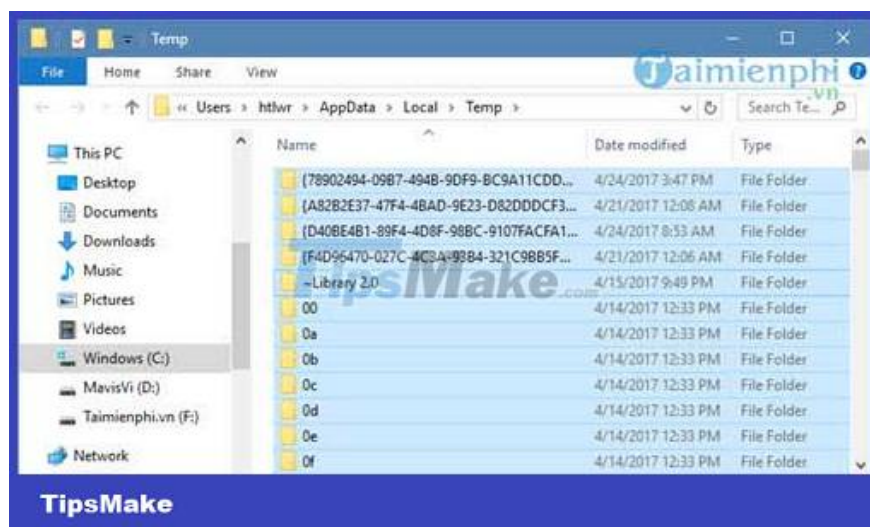

Step 11: Also you should delete unnecessary junk files on **Appdata, Temp, LocalAppData, ProgramData** or **Windir** . To access them, just open **MenuStart** and type **%Appdata%** if you want to go to Appdata.

- Or **%temp%** if you want to go to temp, apply to the folders just mentioned above.

Step 12: Once inside, delete all junk files in it.

Delete WannaCry, remove wannacry from computer, Laptop

With the above methods, it does not necessarily help you remove the wannacry virus from your computer 100%, but it is somewhat less Ransomware Wanna Crypt on your computer, in addition, you should combine it with updating Windows with the latest patches and software upgrades. Please install your anti-virus software, security companies are also urgently helping their customers to fight against Wanna Crypt Ransomware.
