

# Interesting error, ASUS ROG Phone became the first smartphone in the world to know 'charging itself'

A member of the Reddit forum has just shared his interesting discovery that many people can enjoy. That's when using only a single USB cable, plugging into two USB-C ports together on an ASUS ROG Phone smartphone, it can 'charge itself.'

A member of the Reddit forum has just shared his interesting discovery that many people can enjoy. That's when using only a single USB cable, plugging into two USB-C ports together on an ASUS ROG Phone smartphone, it can 'charge itself.'

ASUS ROG Phone is a special gaming smartphone with up to 2 USB-C ports on the camera body, while regular smartphones only have 1. Its purpose is to help players who can charge the battery to play games continuously without interruption and can attach other accessories for data transfer, computer synchronization .

When using a USB-C cable to connect the two ports together, the ASUS ROG Phone will assume that it is being charged, showing the charging icon and displaying the message to allow the data to be transferred. USB connection by itself is an external hard drive.

However, in fact, this is just a mistake because the ASUS ROG Phone does not distinguish itself from being plugged in, but its battery will not increase capacity.

This is a pretty interesting finding, but users should not do so often because it can cause conflicts for the device's components.
