

Invite Firefox Reality experience, the browser for virtual reality world

Mozilla has officially released a new browser version called Firefox Reality for virtual reality (VR) platforms on devices like Oculus, Daydream and Viveport.

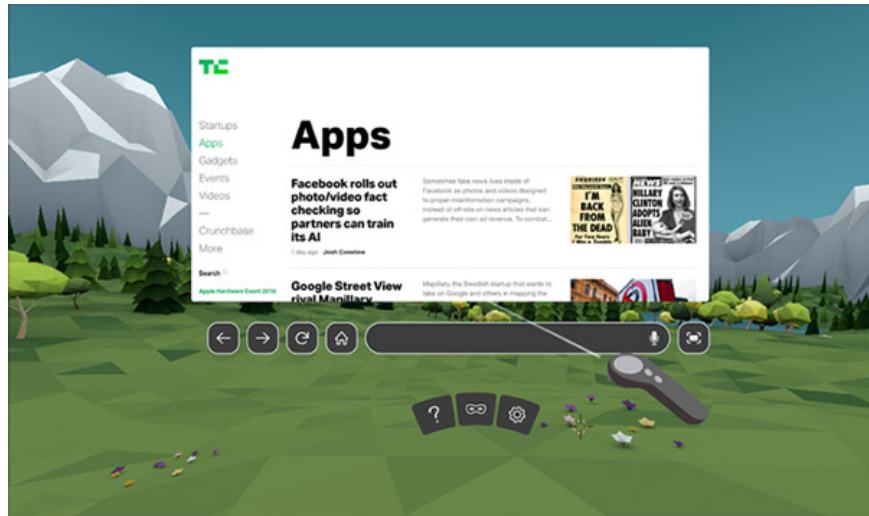

Mozilla has officially released a new browser version called Firefox Reality for virtual reality (VR) platforms on devices like Oculus, Daydream and Viveport.

From the beginning, Firefox Reality was built for VR, so the development team dedicated it to a lot of resources to ensure the most natural and intuitive experience on VR wearable devices. For example, you can choose to use the voice to access the website you want to see in the browser instead of the traditional way of typing in the browser address or query. Meanwhile, the voice will be the most natural method when users use the VR joystick to type on the virtual keyboard.

Mozilla hopes Firefox Reality will become a bridge between 2D and immersive content in VR to help users display content more easily.

The popular and popular content around the world of the web will be displayed at the browser homepage to help users get a unique experience from virtual reality.

Firefox Reality is built on Quantum engine, the tool is expected to bring better performance and has been deployed for other platforms since the beginning of this year. Besides, Mozilla also committed that the Firefox Reality browser still ensures privacy and security for users.

Currently, the browser for the virtual reality world still lacks some common features such as 360-degree video viewing, bookmarks, etc. But Mozilla said the shortcomings will soon be fixed in future updates.

From now on, users can access the link below to download and experience this Firefox Reality browser or go to Viveport's store to search by browser name.
