

iOS 13 caused PUBG Mobile and Fortnite to be interrupted, gamers do not rush to update

According to PUBG Mobile and Fortnite gamers, the new touch operation on iOS 13 makes them unable to control the characters in their games well.

Yesterday (September 20, 2019), Apple officially released iOS 13. But after just one day of launch, this updated version has received a series of complaints from gamers, especially users. PUBG Mobile and Fortnite enthusiasts.

According to PUBG Mobile and Fortnite gamers, the new touch operation on iOS 13 makes them unable to control the characters in their games well.

For both PUBG Mobile and Fortnite games, to control the character and perform operations, the player must use multiple gestures simultaneously on the touch screen. Specifically, to move the user character needs to hold two fingers on the screen and use the third finger for other functions. However, iOS 13 defines the three-finger tap gesture on the screen as an option to edit text details, causing the screen to be interrupted.

Tencent, the company behind PUBG Mobile, said it will work with Apple to resolve the issue and recommend that players should not update to the latest version of iOS. Meanwhile, Epic Games, the manufacturer of Fortnite has not made a statement yet.

On Twitter, the PUBG Mobile development team said that this situation does not occur with the iOS 13.1 beta. Therefore, users should wait until iOS 13.1 version released on 24/9 to update the new operating system version for iPhone.

In addition to conflicting touch operations with battle royale games, the iOS 13 update also has many other bugs, such as a security hole that allows hackers to bypass the screen to get information from the user's contacts.
