

iOS 13.1.1, just released, has been cracked with Apple's unpatchable security hole

Axi0mX shared a video showing the iPhone X running iOS 13.1.1 has just been successfully jailbroken.

A few days ago, a security researcher with the nickname axi0mX announced a new security vulnerability called 'checkm8', which allows cracking all iPhones stretching from iPhone 4s to iPhone X in every iOS version. In particular, this vulnerability is a hardware flaw, so Apple cannot patch or fix bugs with software.

And to prove what they have discovered, Axi0mX recently shared a video showing the iPhone X running iOS 13.1.1 has just been successfully jailbroken.

iPhone X running Apple's latest iOS 13.1.1 is easily jailbroken.

This guy said, using the security checkm8 he could crack the iOS version 13.1.1 that Apple just launched a few days ago within 2 seconds.

According to Axi0mX, the checkm8 flaw allows users to jailbreak their iPhones despite updating to the latest iOS version.

1. Apple released iOS 12.4.2, which supports older iPhones and iPads
2. iOS 12.4 was cracked after only a few weeks of launch due to the mistake of Apple and an anonymous developer
