

iPhone 7 will have to offer to lose the iPhone 8 super product by 5 outstanding features later

Only about 6 months left, the next generation iPhone will be released, and for that reason, the rumors surrounding this phone also appear more and more.

Only about 6 months left, the next generation iPhone will be released, and for that reason, the rumors surrounding this phone also appear more and more.

Part of the reason for the curiosity is Apple's first 10-year anniversary of the iPhone (2007-2017), and experts believe the technology giant will have a big plan for the army. My next post.

Known for its confidentiality, Apple never revealed any news about the new product before it was published, so it was impossible for the company to confirm or deny the information. However, the rumors below are also somewhat satisfying fans of this phone.

1. Large size OLED display

Since appearing until now, Apple has always been successful with LCD display design on most of their iPhone series. This can be clearly seen in the two cult iPhone that Apple recently launched is that the iPhone 7 and 7 Plus still carry in themselves the IPS LCD screen. However, over time, the technology trend is growing, LCD screens start to become obsolete and it becomes the weakness of the iPhone compared to the high-end Android smartphones on the market today.

Because of this, there are rumors that Apple will integrate this iPhone 8 with a unique OLED screen and size of 5.8 inches. The advantage of OLED technology is that it consumes less power, can display deeper black and has a wide color gamut. This will be a completely new improvement with the Apple house that gives many people the expectation of this new birth.

2. Wireless charging

According to the researchers, the iPhone 8 will use the glass cover frame to better support wireless charging mode.

Wireless charging mode has become the production trend of high-end Android products, so to keep up with this new technology Apple has also joined the industry group called Wireless Energy Association earlier this year. to prove it.

If this information becomes true, the iPhone 8 will be the first smartphone in the history of iPhone series to be integrated with wireless charging.

3. Use completely new design

Although this year iPhone 7 and iPhone 7 Plus have a lot of success in terms of sales thanks to the reasonable improvements that Apple brings, but these improvements are not enough to satisfy many people, there are still opinions. Contrary comments on new designs launched. Many people believe that the shape of the iPhone 7 has not changed much compared to the iPhone 6 - the phone was born 3 years ago.

So, in order to meet the desire of the iFan community, it seems that this year the Apple house will bring to iPhone 8 a completely new design with a metal frame - luxurious glass with a variety of color options Fancy, unique.

4. Face detection ability

We may not be too unfamiliar with the sky prices of iPhones, recently many sources revealed that the price of the iPhone 8 is estimated at around US \$ 1,000 (about VND22.7 million) for one such device But this still does not flinch the fans. The explanation for this iPhone 8 is such a high price because the product carries in itself the

superior technology, one of which is the ability to identify faces.

Accordingly, it is possible that the high-end iPhone that Apple is about to release will recognize the face of the owner thanks to the new laser sensor, combined with infrared sensor placed on the front of the device. This will help iPhone 8 bring more security options to users than iPhone 7, which only owns fingerprint sensors.

5. Scan fingerprints right on the screen

To help users get the most interesting technology experience, Apple has removed the physical home key - which once attached to the history of iPhone development to equip the iPhone 8 with a unique "touch zone". Original allows fingerprint scanning right on the screen.
