In the past week, a series of computer systems from Google, Microsoft, Skype and Yahoo in the US have been attacked by news. After the investigation, technology experts found that the direction of the attack originated in Iran. Shortly thereafter, a hacker nicknamed *Comodo* claimed to be responsible for these attacks.

In a message posted on the Internet in English, Comodo said: *' I know you are very surprised by my skills, speed and knowledge in this attack. I had the support of about 1,000 hackers in Iran to carry out this attack. We want to protect leaders and Iranian scientists against Western enemies. When the US and Israel built Stuxnet, no one blamed it or talked about it. Therefore, I did not feel anxious when conducting the attack '.*

According to Jacob Appelbaum, a security researcher at the Tor Project non-profit organization in the US, the attack was conducted on the early days of March. He said that Mozilla and Google quietly continued to update the latest versions of the two browsers, Firefox and Chrome, to avoid Comodo attacks.

Meanwhile, Mikko Hypponen, head of research at computer security company F-Secure, said it was **not clear whether Comodo was just a person or a cyber security agency.** : *' The hypothesis that a 21-year-old young man can attack well-guarded computer systems in the US is not convincing. I'm not sure if this is an Iranian government counter-attack . '*

In September 2010, Iranian officials admitted that the **Stuxnet worm infected at least 30,000 computers running Windows operating systems in the country.** Earlier, experts from Iran's Atomic Energy Organization also reported meeting and discussing how to remove the malware.
