

Kajona CMS system launched version 3.3

Kajona, the open source content management system, has officially released the latest stable version 3.3.

TipsMake.com - Kajona, an open source content management system, has officially launched the latest stable version 3.3 here . Comes with the latest patches, security updates and a few basic bugs, more features for administrators and ordinary users. For example, version 3.3 adds the SQLite database system and the tree view - tree view feature, of the administrator account for faster control.

Developers have also added some other features to the admin page, in version 3.3, users cannot copy the entire content of the page, but can still do with each part arranged by zone. area. Portal Editor's activities for direct content editing are re-arranged, simplifying maximum API function to ensure the process of processing too many data streams by the number of visitors at the same time. .

Details of changes and updates in Kajona 3.3 version are fully posted here and here. Online demos are available, or the LiveCD version works in the Knoppix platform here. Kajona is licensed to operate as LGPL.
