

Kaspersky 'slipped' anti-spam test

There have been 14 software that passed the VBSspam anti-spam test and the only 'sliding competitor' is the reputable Kaspersky security software.

Security magazine Virus Bulletin has just announced the results of the testing of the 15 most popular security software in the world today.

According to test experts, Kaspersky software has a low false detection rate but at the same time it also loses many 'genuine' spams.

However, experts claim they are satisfied with the general capacity of security software on the market. '*In the past 10 years, spam has changed from being just a common harasser to a criminal level and threatening cyber security. In the near future, this problem will not be reduced*', said Martijn Grooten, the test director, 'Even so, the test results show that security companies have put a lot of effort into protecting people use'.

Virus Bulletin appreciates the anti-spam capabilities of software from MailMarshal, SpamTitan, Microsoft, Forefront, Symantec Brightmail and Webroot.
