

Laptop Maintenance

'Stable in people' and with laptops are no exception. The life of a laptop depends on the 'treatment' of the user. We would like to give you some attention to help you use your laptop in the right way and safer.

'Stable in people' and with laptops are no exception. The life of a laptop depends on the 'treatment' of the user. We would like to give you some attention to help you use your laptop in the right way and safer.

Keep your laptop in your pocket when you move

One of the laptop's strengths is portability, but for many users, being reckless while moving laptops often leads to unexpected problems. Laptops need to be stored in a dedicated bag, this bag is specially designed to keep the laptop firmly held in a fixed position, avoiding any movement in the process of moving. Placing laptops in non-specialized bags or pairs is in principle wrong. Laptop screens are easy to break due to collisions or being squeezed by external objects. Do not put it directly on the desk The environment temperature in Vietnam is much higher than the environment temperature in many countries producing laptops, which makes it easy to fall into a hot situation.

If you leave it directly on the desk, because the machine has no space to release heat, the machine will overheat, which may lead to a hangover. To overcome this situation, you should put your laptop on two books with certainty. With space, the machine will produce heat.

Do not work with the laptop on the lap Computer when working generates a significant amount of heat that adversely affects the user. Especially men. For those who regularly use computers working on the thighs, the ability to infertility is many times higher than normal people. Soft laptop opening and closing Similar to folding mobile phones. When using a laptop, you have to open and close it gently, most of the diseases of the laptop are broken because of the opening and closing too strong. We should only open the screen from 90 ° - 120 °. If this angle is exceeded, it will lead to a broken screen. These two diseases of the laptop are very difficult to overcome, and replacing components is also very expensive and extremely rare.

Battery maintenance

One problem for many computer users is the battery's durability and quality. When buying a computer, the entire machine has a 3-year warranty, but with only one year battery. With newly purchased laptops, consumers can be assured of battery quality. The main problem is in use. The price of a battery on the market is not cheap - about 150USD. Therefore, maintenance for a laptop's battery is very important, which helps us not to spend the extra money.

Computer manufacturers recommend consumers to supply battery charging power continuously until the battery is full (for more than 10 hours), and should only charge when the battery is completely empty or should not be used when the battery is not full. For new machines or machines after a few months of not using this, you need to repeat it at least 3 times.

For each type of battery there are different uses. Metal Hydride batteries, Metal Hydride, should be used every few months before charging.

As for Li-ion batteries, you should not wait until the end is complete, because the battery may be short-circuited, reduce the life and cause danger to the user. With regular laptops, when you want to discharge the battery, the user must unplug the power cable manually, then plug the laptop power cable back. Currently, there are a number of laptops available with Refresh utilities running in Windows environments that are very convenient for use. With these types of machines, if fully charged, it will automatically discharge without having to unplug the power cable.

Incorrect use of batteries such as: not using the battery for a long time, incorrect charging times, temperature changes . all affect battery life.
