

Laptop running Google Android

Following the success of the Nexus tablet running Android, Google is preparing to release a laptop called Androidbook in the third or fourth quarter of this year that runs the company's mobile operating system.

Following the success of the Nexus tablet running Android, Google is preparing to release a laptop called Androidbook in the third or fourth quarter of this year that runs the company's mobile operating system.

Citing sources *Digitimes* said, the appointment of the head of Chrome OS, Sundar Pichai, is taking over the top position of Android to expand Google's ability by launching a laptop running its own operating system. Meanwhile, some analysts predict that Google will merge Chrome and Android, but information from *DigiTimes* shows a completely different move.

Illustration

If the laptop named **Androidbook** exists, the device will be able to support touch to make the most of the power of this mobile operating system, allowing users instant access to the large application library on Google Play, a more attractive option than a Chromebook.

In February, Google launched a Chromebook Pixel with a touch screen, but it didn't run Android apps, along with an expensive price tag (\$ 1,299 for Wi-Fi only) or \$ 1,499. for version that supports 4G LTE. Therefore, the launch of Androidbook is expected to provide a much more competitive selling price.

If Google develops a new Android-based laptop, it's likely that the company will disclose this information at the **Google I / O 2013** event that will take place in San Francisco in May.
