

Launched the world's smallest and lightest laptop

Computer maker UMID (South Korea) has unveiled the smallest and lightest mini-laptop (mbook) in the world but is equipped with high-speed communication features.

Computer maker UMID (South Korea) has unveiled the smallest and lightest mini-laptop (mbook) in the world but is equipped with high-speed communication features.

The product is a tiny design with only 4.8-inch screen but has a resolution of 1024 x 600 pixels, measuring 158 x 94.1 x 18.6mm and weighing 315g. The mbook has a built-in speaker on the screen and a 1.3Mp webcam.

Two versions to be released will be equipped with Intel Atom 1.1GHz and 1.3GHz processors. Both are equipped with 1GB of memory, but Flash storage drives are 8GB and 32Gb in size.

According to the UMID manufacturer, the product was created to target high-speed communication technologies integrated on devices such as HSDPA technology, Bluetooth 2.0 and WiBro (just like WiMax, internet technology broadband cord developed by the company in South Korea).

While compact, the mbook is fully equipped as a laptop, which is four in a memory card slot, a mini USB 2.0 port and a Qwerty keyboard. The product has a battery life of up to 6 hours.

In addition, the device also has an antenna to receive radio signals but only works on AMB frequency bands rather than DVB-H frequency bands. Therefore, the product can receive signals from TV stations in South Korea.

However, the company still has no official announcement about the price or the time of launching the product to the market.
