

Leaking clear image of Samsung Galaxy Note 10 Pro: A lot of design improvements

Rumors of Samsung Galaxy Note 10 Pro's appearance as well as hardware performance appear to be rampant on many major technology forums and sites recently.

Rumors of Samsung Galaxy Note 10 Pro's appearance as well as hardware performance appear to be rampant on many major technology forums and sites recently. However, we have to wait until the famous leaks like @Onleaks and Pricebaba publish the first leaked photos, so we can really get a really clear view of one of the most popular flagship models. smartphone world in the shopping season later this year.

1. Leaking image of Pixel 4: Finally, Google also 'suffered' with multi-sensor camera cluster?

Photos leaked about Galaxy Note 10 by @Onleaks and Pricebaba

The leaked photos released by @Onleaks and Pricebaba a few days ago show that the upcoming Galaxy Note - Galaxy Note 10 will have a completely new design, marking the development and significant change in terms of language. The design that the Korean manufacturer brought onto its top phablet this year, compared to its predecessor Note 9 as well as the products it launched last time, has begun to be boring in design. overall.

A new point is worth noting, this year, Galaxy Note will be launched with 2 variations, comes with 2 sizes and different hardware equipment. Specifically, the product with a higher price and configuration will be a huge 'Note 10 Pro' with a 6.75-inch screen, while the Note 10 usually 'only' stops at 6.3 inches and will certainly cost. sell cheaper. Both variants share the same look, and will almost exclusively differ in hardware and size.

1. Google officially launched 2 mid-range smartphones Pixel 3a and Pixel 3a XL

Note 10 will have 2 versions with different sizes

Samsung seems to be getting closer to the 'completely' overflow screen design, filling the entire front of the Note 10 with the screen coverage even better optimized than the previous version. Thus, the screen on the Note 10 will be expanded further towards the two ways above and below. To do this, Samsung will likely have to adjust the position for the camera cluster and the front sensor, move them to the center, at the top of the screen.

Looking at the leaked image, it can be seen that the balanced camera design in the middle will feel more harmonious than the one on the right corner of the screen like on the Galaxy S10. But hopefully this camera cluster and sensor will be a little more refined in the final product to the user.

1. Admire Galaxy S10 + limited edition Park Hang Seo, very strange colors, unique accessories that make football fans ecstatic

On the positive side, Samsung knows how to 'save' the front space for the screen. More praiseworthy, the company has almost eliminated the uncomfortable 'chin' at the bottom of the phone, replacing it with the bezel border even more compact than the Galaxy S10.

Another point to note, the four corners of the Note 10 will be "sharpened" significantly more than the Note 8 and Note 9, making the Note which is characterized by the square design now more and more recognizable. more and more, as well as somewhat reminding us of a glimpse of the popular Nokia Lumia for a while.

Note 10 will no longer have a 3.5mm headphone jack

1. Huawei stopped manufacturing computers, reducing US smartphone production

But everything must have a trade-off, to achieve the optimal design, Galaxy Note 10 must sacrifice 3 things: First will be the unfortunate "departure" of the traditional 3.5mm headphone jack . At the same time, the quick activation key of the poor Bixby virtual assistant will no longer appear on the new Note. The same thing happens with the fingerprint sensor, but for me personally this is good news because the high possibility that the Note 10 will also switch to using the built-in fingerprint scanner on the screen.

Talk a little bit about the back. The most prominent will still be the following 3 sensors camera cluster similar to Galaxy S10 but placed along the left side, parallel to that 3 flash bulbs create a certain harmony. The Note 10 Pro is also likely to be equipped with a time-of-flight 3D sensor similar to the Galaxy S10 5G, while the smaller Note 10 will not be equipped with this high-end 'toy'.

1. Invite to see Samsung's Galaxy A80 'hot' BlackPink version

With the Note 9 released last year, Samsung has made the whole world "admire" as it performs a series of interesting magic tricks with the S Pen, such as pressing and holding the Bluetooth button on the S Pen. To quickly launch the Camera, use the S Pen to pause or play the song without directly opening the phone, switching presentation slides with the S Pen, or great support for 3rd party applications. father. Thus, we can look forward to seeing more of the new practical uses of the S Pen - the infamous 'infamous name' toy on the Note line.

Summarize some rumors about performance. In recent years, Galaxy Note has made many people disappointed when only being evaluated as a larger size version of the Galaxy S.

1. Give up your smartphone to use a flip phone for 1 week, get 1,000 USD right away

Galaxy Note 10 will be greatly improved in performance

This may change this year as rumors are pointing out that the international version of the Galaxy Note 10 will be equipped with the new generation Exynos 9825 processor - manufactured on the 7nm process, more powerful than with Galaxy S and of course will not lack the ability to support the trendy 5G network connection. There will also be a version equipped with 12GB of RAM.

Galaxy Note 10 with many innovative features and new exclusive S-Pen pen will likely have a starting price of 25.5 million VND and will be available in late August before the time when Apple rivals new products like Samsung's annual tradition.
