

Lesson 37: Form Validation in Bootstrap 5

Form validation provides valuable feedback to the user. In this Bootstrap tutorial, let's learn how to add validation to forms in Bootstrap 5!

Form validation provides valuable feedback to the user. In this Bootstrap tutorial, let's learn **how to add validation to forms in Bootstrap 5** !

Form verification

You can use different validation classes to provide valuable feedback to the user. Add `.was-validated` or `.needs-validation` to the element, depending on whether you want to provide validation feedback before or after submitting the form. Input fields will have a green (valid) or red (invalid) border to indicate missing information in the form.

You can also add messages `.valid-feedback` or `.invalid-feedback` let users know exactly what is missing or needs to be completed before submitting the form.

Essentially, the code below adds validation to a form using Bootstrap 5. The sample code `.was-validated` shows what information needs to be filled in before submitting the form:

```
Username: Valid. Please fill out this field. Password:  
Valid. Please fill out this field. I agree on blabla.  
Valid. Check this checkbox to continue. 
```

For example:

```

```

Form verification

For example, if you submit a form but haven't filled in all the information, you will receive a notification like the one below.

```
