

# Instructions for adjusting light for photos using AI

If your photo is underexposed or we want to change the brightness of the photo in a more special way, we can take advantage of AI technology to edit the photo.

If your photo is underexposed or we want to change the light area of the photo in a more special way, we can take advantage of AI technology to edit photos without having to do too many operations, or need photo editing software that you are not proficient in. With the website in this article, we just need to upload the photo and choose the lighting style for the photo that we like. Below is how to adjust the light for photos with AI.

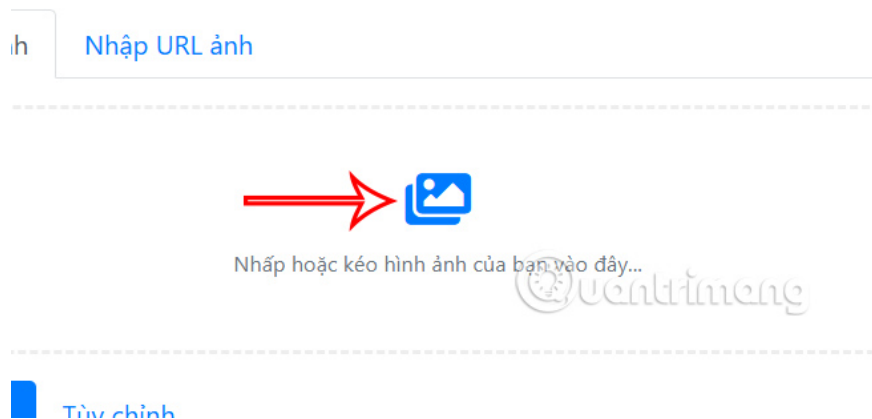

## How to adjust photo lighting with AI

### Step 1:

First, you access the website below to access the page to adjust the light for photos using AI.

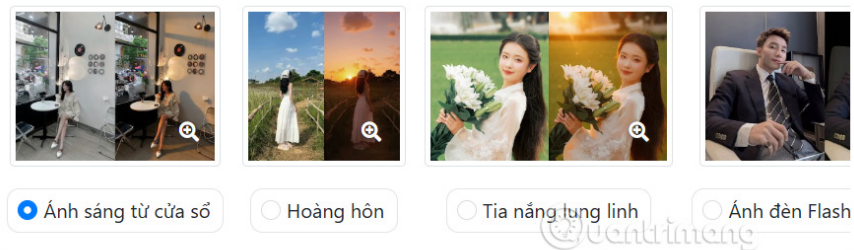

<https://taoanhdep.com/tai-cao-anh-sang-cho-anh-bang-ai/>

At this interface, you upload the photo you want to adjust the brightness to the website.

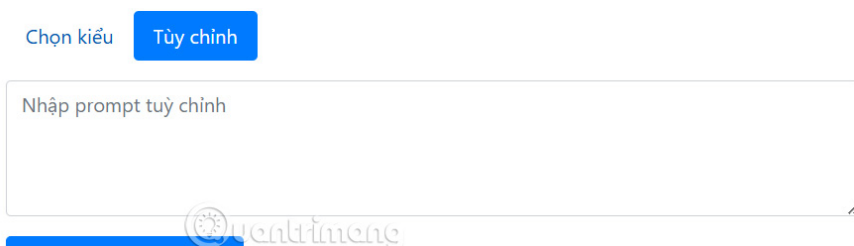

### Step 2:

Then you **choose the type of lighting** you want to use for your photo. There are many different types of lighting, depending on what your original photo is like and how you want to add light to your photo.

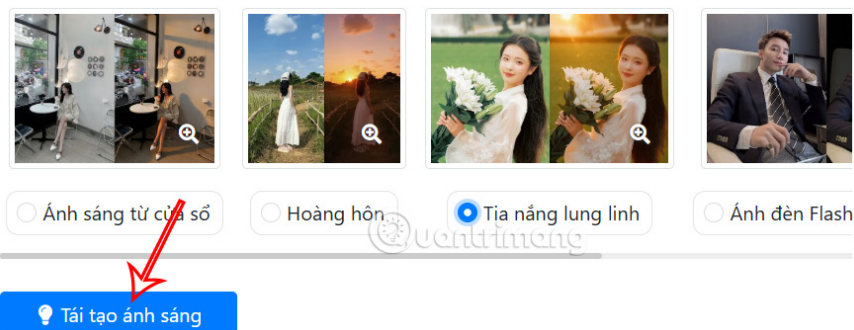

Or you click on **Customize** and **enter the photo editing command** for AI to analyze the content.

### Step 3:

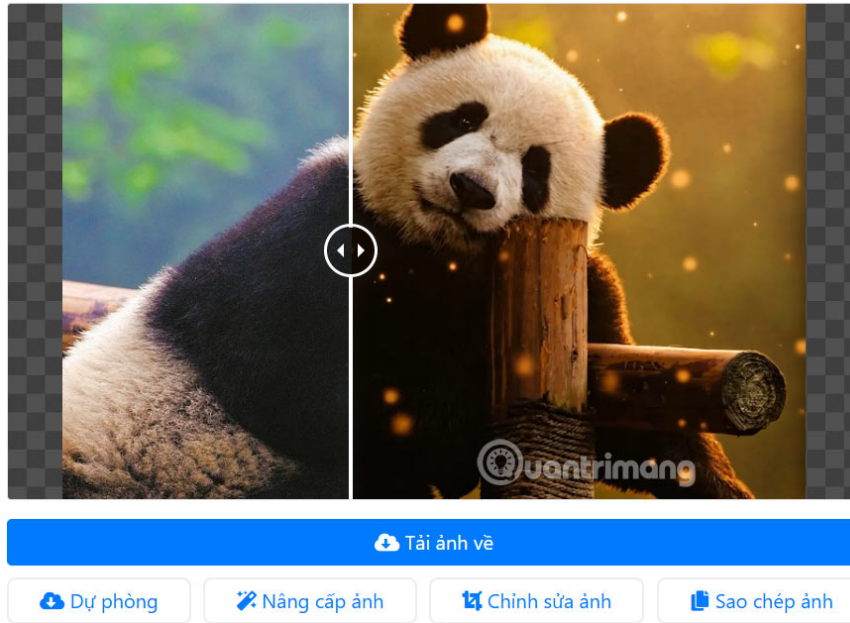

After **selecting the photo editing style** with light, click **Recreate Light** to perform.

Wait a moment and you will see the light adjusted image as shown below.

We will see a comparison between the un-lighted photo and the photo with added light. If you like it, **click Download Photo** .
