

List of Asus motherboards that support Windows 11

To be able to upgrade to Windows 11, a user's computer needs to meet a series of requirements related to hardware configuration. Among them is an element that is receiving a lot of attention, which is TPM 2.0.

If you don't know, TPM (Trusted Platform Module) is a secure cryptographic processor that helps you perform actions like generating, storing, and restricting the use of cryptographic keys. Some TPM chipsets also include physical security mechanisms to prevent malware from tampering with the TPM's security functions. Usually, the TPM chip will be soldered directly to the motherboard.

Therefore, to know if their PC can be upgraded to Windows 11, users need to determine whether the motherboard they are using supports TPM 2.0.

Some well-known board manufacturers such as Biostar, Gigabyte, MSI, ASRock, etc. have begun to publish a list of product lines that support Windows 11 compatibility. Here is a similar list from Asus. .
