Photos describe new patents on Macbook

*Neowin* on 29 January reiterated the USPTO's source, saying that the Apple patent specifically describes a future Macbook computer that will have two screens, with an ordinary screen inside and a touch screen. The application is located on the back of the device.

This touch screen can help the Macbook become a tablet for convenient use. In particular, this monitor can be combined with a solar panel to convert it into a battery used on a computer.

This is a fairly advanced technology, but, in order to be able to apply and market it, it still needs a long time to study.
