

MacBook Pro 2021 and the series of upgrades are worth the wait

In the past days, information about the MacBook Pro 2021 models has been continuously posted on the online newspaper. Not only owning a new M1 chip, this Macbook 2021 also comes with an impressive series of upgrades that are worth looking forward to.

Unfortunately, up to this point, the MacBook Pro 2021 launch date has not been confirmed. According to leaked sources, this is definitely the successor to the MacBook Pro M1 worth waiting for in the near future.

Slim design, better heat dissipation nhi?t

Many reports suggest that the MacBook 2021 will have a slimmer, flatter and lighter design than its predecessor. A recent leak also shows that Apple will most likely phase out the 13-inch MacBook Pro with a larger 14-inch version. This promises to bring a more spacious working space for users.

Before that, the MacBook Air M1 and MacBook Pro M1 2020 were both designed based on the Intel version. However, the cooling system is still not as good as expected. Therefore, in this new generation of MacBooks, the M1X / M2 chip will be refined and compact by Apple, and other parts are also encapsulated to improve the cooling capacity of the machine.

Powerful new M1X chip

Both the MacBook Air 2021 and MacBook Pro 2021 will be powered by an M1X (or M2) chip with at least 10 graphics cores. Including up to 8 high-performance cores and 2 energy-saving cores. Although it is only 2 cores

better than the M1 chip, the performance is very promising because the number of performance cores is twice as high as the M1 (M1 is 4 + 4).

Picture 2 of MacBook Pro 2021 and the series of upgrades are worth the wait

Some sources even believe that Apple can create a 16-core chip with 12 high-performance cores and 4 power-saving cores for the 16-inch MacBook Pro. This helps to increase the performance by more than 2 times, ensuring to replace the Intel Core i9-9980 HK on the current 16-inch MacBook Pro.

Longer battery life, multi-port support

The current MacBook models are announced to have a battery life of up to 10 hours, but in fact only 5 hours. Therefore, we can fully expect the MacBook Pro 2021 to have over 10 hours of actual battery life, meeting a working day.

Many reports also suggest that the legendary MagSafe charging port will return. Therefore, this year's MacBook Pro will have more ports, including HDMI, memory card slot, possibly both USB-A and Thunderbolt.

It is expected that both the 2021 MacBook and the 2021 MacBook Pro will be released later this year. Although it may not come with a mini LED screen, but with the above upgrades, it is still a MacBook worth waiting for.
