

## Marvel at red-blooded animals in Vietnam

The red-bellied cicadas, from the time they were larvae, were all red like a chilli.

Vietnam possesses a diverse fauna, rich in composition and species. Many of them have strange shapes and colors. In particular, there are species that possess a blood-red color that is extremely prominent and attractive, which makes us not be surprised.

Cicadas are animals that are quite close to us, especially those in rural areas, but red cicadas are bloody, perhaps not everyone knows. It is the *Huechys sanguinea* that lives in many forest areas of Vietnam. From the time they were larvae, their whole body was glowing red like a chilli.

In contrast to the glowing red on their bodies, their wings were white, delicate like an angel. The strange thing is that after a short time in the sunlight, their wings gradually change from white to black.

After that strange color change process, the body of the red belly cicada became more sturdy and luxurious with 2 colors of red and black.

This is a bird with a very beautiful name, a **flower bird** (*Amandava amandava*) is a bird of the family. Birds of the species live in tropical fields and grasslands in Asia.

The birds of this bird possess a vivid red color. On the wings and the lower part of the abdomen are milk coffee brown, spots of white spots look like paint scales.

Due to the beautiful appearance, this bird is kept in captivity very popular as a ornamental bird. In Vietnam, this bright red bird is also very popular.

Going against the laws of nature, the more sprawling, the **red-spotted snakes**, the scientific name *Oreocryptophis porphyraceus* is completely non-toxic, and quite gentle. The strange snake impresses at first sight with its bright red body with two black stripes running along its body.

Red-spotted stripe snakes are often found mainly in northern Vietnam national parks. They prefer to work mainly from dusk overnight to dawn the next day. In the daytime, they hide in the leaves, under the moss or under the rocks or stumps. The main food of red-spotted snake stripes is amphibians and small rodents.

Red spider is a pest of plants. They are very small in size, the whole body is red like blood.

They have a relatively short life span of about 15 days, each of which can lay hundreds of eggs.

The 7-spot ladybug has the scientific name of *Coccinella septempunctata*, they live everywhere. Their food is aphids.

The name of the 7-spot ladybug comes from their appearance. All of the two hard wings have a bright red color but each wing has three black spots and one spot is at the connecting point of the wings, a total of 7 black spots.
