

Microsoft closes loophole people tried to bypass when installing Windows 11

Microsoft has just released the latest update of Windows 11 for Windows Insider users on the Dev Channel.

This version comes with many new features and settings, but at the same time it also removes the `bypassnro` script - a simple and effective method to complete system installation without logging into a Microsoft account.

Installing Windows without a Microsoft account is not possible with Microsoft's new way of doing things.

The company has confirmed that the removal of the script was not an accident or mistake. In a blog post, Microsoft said: 'We are removing the `bypassnro.cmd` script to improve the security and usability of Windows 11. This change ensures that all users complete setup using an internet connection and a Microsoft account.'

The absence of this script will make it difficult for people who want to install the system without an internet connection or do not want to log in to a Microsoft account, such as in a network-free environment or when wanting to use a local account. Previously, users could do this without any problems.

Signing in to a Microsoft account for Windows brings many benefits, such as easy access to Microsoft 365 and OneDrive services, automatic local disk encryption, encryption key backup, and settings syncing between PCs.
