

Microsoft developed the technology to feel user mood

Techworld Australia said that Microsoft Research Asia is in the process of researching technology that allows smartphones to sense users' moods and post on social networks in real time.

Techworld Australia said that Microsoft Research Asia is in the process of researching technology that allows smartphones to sense users' moods and post on social networks in real time.

Accordingly, **Microsoft** experts have developed a software system that feels mood running on smartphones. Currently the system results in an accuracy of about 66% and is still in the process of being completed with a very positive future.

It can be said that this is the benefit of owning a smartphone capable of telling the world how you are feeling in every moment.

According to Microsoft researchers, if you leave privacy aside, this feature will become quite useful when allowing automatic posting of lines describing the user's mood on social networks, helping those others know better when and how to connect with them.
