

Microsoft explains why folding phones will be the next big innovation of technology

Microsoft explains why now is the right time for phones to fold two screens.

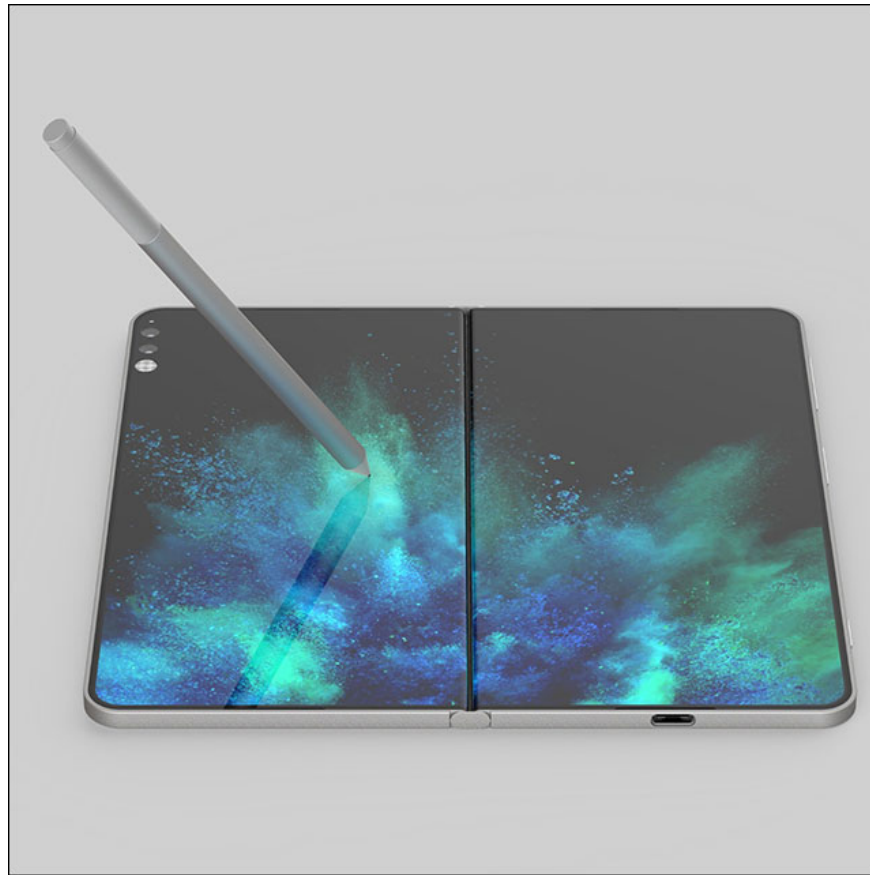

We have seen the phone roll out in the market with ZTE Axon M and according to rumors, in the next few years, it is possible to look for products from big market leaders like Samsung or Microsoft Surface.

In the patent application, Microsoft explains why now is the right time for phones to fold two screens.

'Along with more advanced functions is the need for a larger screen to provide a better user experience. Phone screen size has increased to the extent that it can occupy the entire front. To increase further will need to increase the phone size. This is not wanted because the user wants to hold the phone in his hand, put it in his pocket, pocket.

Therefore, 2-screen devices are increasingly popular. With these devices, the phone or tablet will have an extra space, where both screens pair together making them feel like a screen.

When folded, 2 screens are left to protect. When you want to open it, the user will turn over so that the two screens stand side by side. "

Folded screen is a solution for human use needs

The screen has increased in size to the maximum and to meet its convenience needs, the only way to use the larger screen is to fold it up.

In this context, the folding screen is only a natural and understandable step, there will be more and more manufacturers approved and approved by many users.
