

# Microsoft fixes errors that are criticized in Windows Office

Yesterday, Microsoft officially fixed 5 errors on Windows Office, mainly hackers errors discovered in previous months.

***TipsMake.com* - Yesterday, Microsoft officially fixed 5 windows office errors mainly including hacker errors discovered in previous months.**

As expected, debugging is fairly straightforward with just four security updates, including five vulnerabilities. Three of the updates were criticized as threatening Microsoft's system. All five corrected errors are criticized a lot earlier.

2 of these errors affect the Windows operating system while the rest directly affect Office. 4 out of 5 errors were limited by Microsoft.

However, this information is still a bit surprising, Microsoft announced last week that two Windows updates could solve technical problems in Windows XP and Windows 7.

The most prominent is **MS10-042**, this update can resolve errors in the support center of Windows XP, which helps users access and download Microsoft files from the web and can be supported by technicians. Help you set up a remote help tool on your computer.

In early June, Tavis Ormandy, a security engineer working for Google, announced the attack code for these errors and immediately affected the Windows Server 2003 system. This caused a heated debate. When some security researchers criticized Ormandy for this announcement, others expressed protection. It is this that upsets Microsoft and draws attention to the computer world.

Ormandy revealed these errors five days after reporting it to Microsoft, but the company did not commit to fixing these errors on time. Microsoft argued and argued that they only told Ormandy that they needed a week to make a decision.

IT users and managers should fix **MS10-042** application **problems** as soon as possible. " *This error is directly directed to the XP desktop system,* " said Jason Miller, a security data manager. One fact is that Microsoft has been straining itself yesterday when their senior leader said XP still accounts for 74% of the market share in computers.

*' I emphasize that Microsoft can handle as quickly as we used to do before,'* Miller said. *'Some bugs still exist in the past few months will disappear.'*

Microsoft mentioned the help system for the first time in May and confirmed that it will completely fix the bugs that appear until June 15.

Another update of Windows is **MS 10-043** single bug fix in 64bit version of Windows 7 and Windows Server 2008 R2. Microsoft confirmed the errors in May, then made a mistake in Canonical Display Driver errors, which could cause the image interface on the operating system to bend.

At that time, Microsoft told users that it was powerless with the Aero interface but would try to improve in Windows 7.

According to Oliver Lavery, director of research and development for nCircle, *' Errors in Windows 7 are due to a program error in Microsoft's department when changing code from 32 bit version to Windows 64 bit version '*

Another pair of errors in the update that is corrected is the input error. Data includes several versions of Office, Outlook, and business email

Two of these are noteworthy: **MS10-045**. Richie Lai, Qualys's bug research director, said: *"The error is under Outlook's security model because attackers can create any file type like other files."* Lai adds, *" This is quite scary. making all attachments become dangerous when opened, so everyone should be cautious"*

*'Hackers can disguise attack code in the form of a.txt, .pdf or .jpg.'* Lai added: *'It will be easy to deceive users when they open and install antivirus software. Those are the types of files that most people will click without thinking twice. '*

Miller from Shavlik and Circle's Lavery made headlines when talking about errors in Outlook. *'This is very interesting because it passed both ' Lavery ' warnings or' Attackers will have to master complex code on the*

*server, so they will not be able to directly attack. But there will definitely be an error during the warning process. '*

Also, according to Microsoft, all current versions of Outlook, including Outlook 2010, will have to be fixed

The fourth update **MS10-044** resolved 2 errors, one that was evaluated as very important in the threat of ActiveX control used by Access.

*' It's almost a shock ' Lavery said ' Active X is somewhat a dead technology but people still find bugs in it. I've been working with it for 10 years even now, Microsoft still hasn't completely fixed these errors. This is foolish '*

This month security updates can be downloaded and installed on Microsoft Update and Windows Update services as well as through Windows Server Update Services.
