

Microsoft may remove unnecessary AI features from Windows 11 following negative feedback from the community.

Microsoft is reportedly considering cutting or streamlining controversial AI features on Windows 11, including Copilot and Windows Recall, following a wave of user backlash.

Recently, we learned that Microsoft is listening to criticisms surrounding the quality of Windows 11 and is committed to fixing them this year. This alone is a positive sign, but things seem to be getting even better. According to new information, Microsoft also appears to have taken into account negative feedback about the excessive cramming of AI into the operating system, and some AI features may soon be removed.

This information comes from Windows Central writer Zac Bowden, who says Microsoft is 're-evaluating its AI strategy on Windows 11'. This reassessment could lead to the removal or streamlining of some features. While no specific details have been given about what will be discontinued, the Copilot integrations in Paint and Notepad are under scrutiny. Bowden also revealed that Microsoft has temporarily paused the inclusion of the Copilot button in system applications, suggesting the company is being more cautious in considering the true value that AI brings to existing tools.

Another point worth noting is that the future of Windows Recall remains uncertain. This controversial feature was heavily criticized by security experts and users from its launch, even being called a "privacy nightmare." Although Microsoft has tried to improve Recall's image, those efforts don't seem to have yielded significant results. At present, Windows Recall may not be completely phased out, but Microsoft will likely reposition the technology for a different purpose.

Conversely, foundational technologies such as Semantic Search, Agentic Workspace, Windows ML, and Windows AI APIs are retained. These components directly serve developers and thus provide long-term benefits to end users, so there is no risk of them being phased out.

Overall, Microsoft's decision to take the backlash surrounding AI in Windows 11 seriously is a welcome sign. In fact, this began in November 2025, when Windows leader Pavan Davaluri acknowledged that while he wanted to make Windows an "agent-driven operating system," there were still many issues to address. This can be seen as a positive start, although it's worth noting that Microsoft has not officially confirmed this information.
