

Microsoft revealed the first details of HoloLens 2.0 virtual reality glasses

Recently, the Microsoft team has revealed some information about the hardware of the upcoming HoloLens 2.0 virtual reality glasses. Read the article below for more details!

We all know that Microsoft is designing the next version of HoloLens virtual reality glasses, but so far there is no official information about this product. Recently, the Microsoft team has revealed some information about upcoming HoloLens hardware. The next version of HoloLens will be the second generation of HPU processors, including an AI processor that supports the network Deep Neural Network capable of running and operating directly on the device.

This means that the upcoming HoloLens glasses can analyze what users see and hear directly on the device instead of wasting time by sending data to the cloud for processing as before. In version 2.0 of HoloLens, the new AI chip will support a variety of layers and can customize it according to user needs.

Mr. Marc Pollefeys - HoloLens technology director said: *This is just an example of the new capabilities that we are developing for HoloLens and you will surely be surprised at what this glasses brings. The combination of virtual reality and artificial intelligence is the future of technology and we are very proud to reach this border.*

">

Microsoft HoloLens is integrated with specialized components like Holographic Processing Unit to handle a large amount of data every second.
