

# Mozilla released Firefox 62.0.2 to fix the problem of corrupting the operating system

Recently, Mozilla has released a Firefox 62.0.2 update to fix serious bugs that could 'paralyze' the operating system discovered on Firefox version 62 days ago.

Recently, Mozilla has released a Firefox 62.0.2 update to fix serious bugs that could "paralyze" the operating system discovered on Firefox version 62 days ago.

This serious Firefox bug has a heavy impact on the user experience, making the browser dizzy and heavy, which could even paralyze the operating system.

1. Detecting a serious error on Firefox browser may damage the operating system

Shortly after receiving feedback from users, Mozilla has confirmed this error and quickly conducted research to fix it. And today, the company released Firefox 62.0.2 emergency patch updates to all versions running on Windows, Linux and Mac computer platforms.

This update not only fixes these critical bugs, but also improves browser performance to give users a better experience.

To check the version of Firefox you are using on your device, click the menu button -> select help -> select About Firefox. In the new window that appears, there will be a version number that appears below the name of the software.

To update to the latest version of Firefox, please see the detailed instructions in the article "How to update Firefox to the latest version".
