

Network acceleration on Android with Internet Speed ??Master

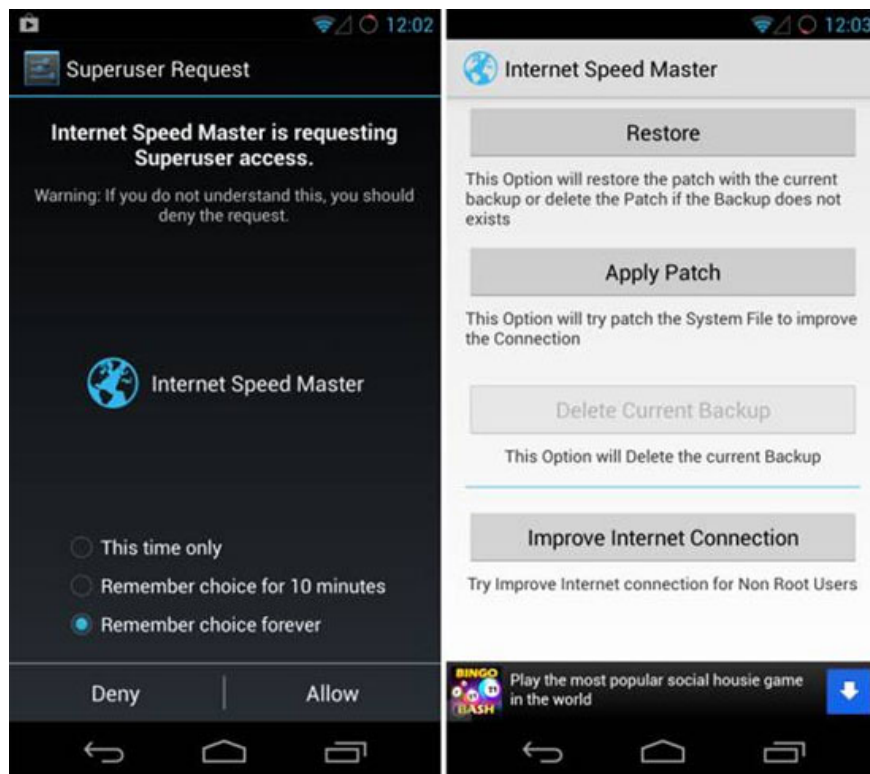

According to the experience of some Android users, their device often suffers from slow Internet speed in connection technologies like Wi-Fi, 3G or 4G.

According to the experience of some Android users, their device often suffers from slow Internet speed in connection technologies like Wi-Fi, 3G or 4G.

Internet access speed becomes sluggish due to many reasons such as weak signal strength, network congestion, faulty hardware or software, technical specifications of the device, etc., making it difficult to identify determine the exact cause. If it is impossible to find the cause of slow transmission of data from the network to the device, it is possible to rely on the help of Internet Speed ??Master. This is a tool to help make some small tweaks and fix some system files on Android to speed up connecting Wi-Fi, 3G or 4G networks in TCP / IP configuration.

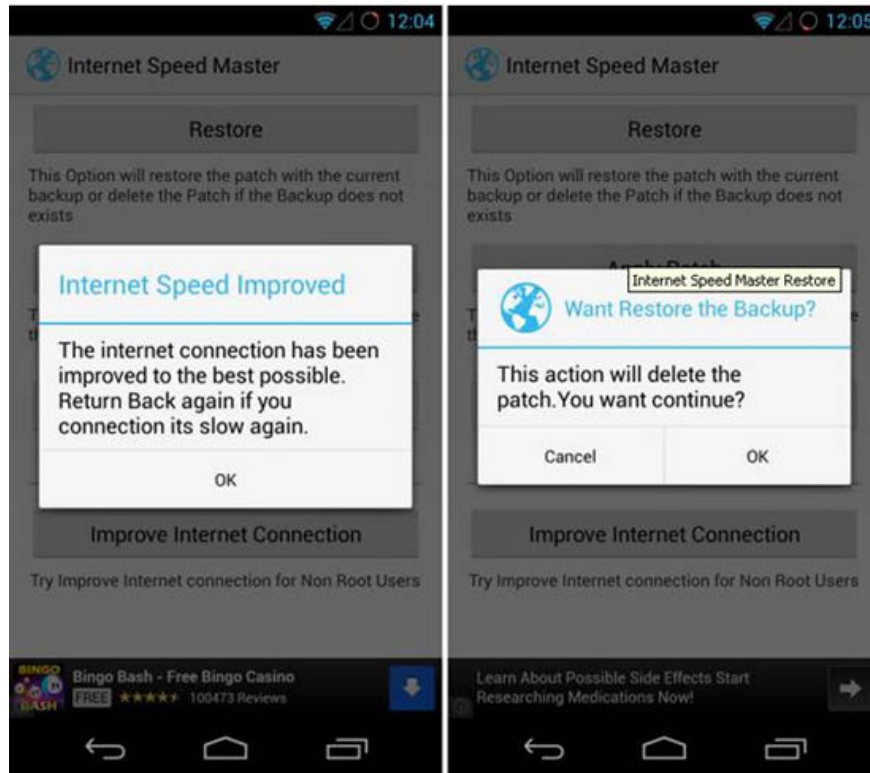

Internet Speed ??Master application has capacity of 819KB, compatible with Android OS 2.3 and above, you can **download the application for free at this address**.

This tool is primarily designed for rooted devices but users can still try their luck on their device, because the application will support some devices without having to root. The tweaks can be changed depending on the ROM you are using and the product lines of each device. When starting Internet Speed ??Master will require **Superuser** access permission on rooted devices, tap the **Allow** button to access the device's main screen.

The new screen features appear clear and simple, only a few buttons and can access features right from the main screen, users will not be able to find an additional menu or device Other complex setups. The application not only allows for tweaking system files but also allows for 'rollback' of previous changes, thanks to the recovery feature. To start using the application, touch the Apply patch button and the necessary files will be modified in a few seconds.

For devices that have not rooted, will not find the *Apply patch* feature, because this feature has been disabled, instead of touching the **Improve Internet Connection** button. The application will not show the notification before making changes, ie the file change will be done immediately when you touch the button.

You do not need to worry about this feature because the application allows recovery to the default state at any time. To use this feature, touch the **Restore** button and then click **OK** , then the application will restore the original file or delete the patch file if the backup file does not exist.
