

Never more reasonable now, upgrade to Windows 10 now

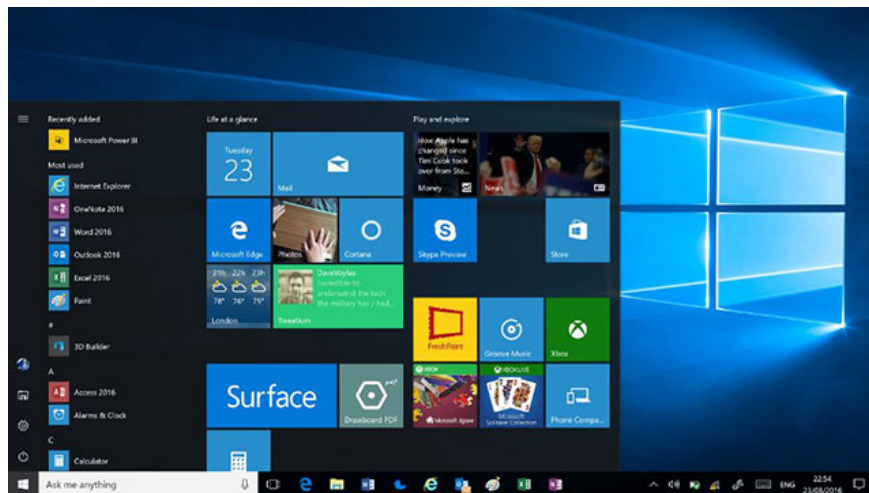

If you're still running older versions of the Windows operating system, this is why you really should upgrade your computer to Windows 10 today.

The recent attack on the WannaCry network has shown threats to computers running the old Windows operating system. While Windows 10 users are not affected, these older versions often have many vulnerabilities that hackers can exploit to invade. More than ever, now is the time to update your computer to Microsoft's latest operating system.

The safest Windows version ever

Needless to say, the current version of Windows is always the safest version. The WannaCry case is a testament to how this malware can attack every version of Windows **except Windows 10**.

Just turn on Windows Update and Windows Defender, users will always get the latest support from Microsoft to ensure safety against network security threats. Regular patches are also a way to protect user computers.

Windows 7 and Windows 8, the newer versions (only after Windows 10) are still officially supported by Microsoft but Windows XP and Vista are not. Supporting the software is sometimes incomplete. So the best way for your computer to be safe is to update to the latest version.

The truth is that if the software you're using doesn't support the new operating system, it's time to wonder if the software is safe.

Useful features

Not only is it more outstanding in terms of security, Windows 10 is constantly updating new features, and of course you don't have to pay any extra money. Over the past 12 months, Microsoft has released **Anniversary Update** updates, followed by **Creators Update** with more and more (and interesting) features. The upcoming update will be **Fall Creators Update**. Windows Hello, Windows Ink are just two of the new features, much more to expect

The Windows Store is also constantly growing when big names like Spotify and Apple's rivals are also preparing to put iTunes on the Store.

Great choice for gamers

Windows 8 is not really a good choice for many PC gamers but Windows 10 is completely different. Not only does it support gamers to play games available on the Xbox, this operating system also offers attractive features like streaming games or game screen shots. Streaming games from Xbox One to a PC is also easy.

The Creators Update version also offers Game Mode, designed to provide a better experience for gamers. Although Windows Store is not the place to bring all the classic names, at least it is the only place where you can

play attractive games like Gears of War 4 or Forza Horizon 3.
