

New feature of Windows Live Messenger 9.0

According to Liveside.net, a site that provides information about Microsoft Web application products: Microsoft's new IM (instant messenger) software - Windows Live Messenger 9.0 - will have many new features, with The goal is to support users' needs the most.

According to Liveside.net, a site that provides information about Microsoft Web application products: Microsoft's new IM (instant messenger) software - Windows Live Messenger 9.0 - will have many new features, with The goal is to support users' needs the most.

One of the important functions added in this new version is the reporting function and control of those who send spam, which is known as SPIM (spam on IM). SPIM is not only annoying for users, but it is also very dangerous. Assuming hackers know an IM account, they can take advantage of that to send spam messages that contain links to some contacts in that account without the recipient's suspicion. When these people click on links, malware or spyware (spyware) can automatically install through poor security browsers or security holes.

Windows Live Messenger

Liveside also said new features include: Allowing users to sign in from different machines. In the previous version 8.5, users will automatically sign out if they log in their account from a new machine. In addition, Windows Live Messenger 9.0 has a number of functions such as:

- .gif tail animation can be used as avatar.
- Allows users to select specific sounds for an activity performed by one of their contacts.
- Can click on the URL directly from the status.
