

No need to install any software, this is how to check your laptop battery level

After a long time of use, your laptop battery will be gradually phased out. In order to determine how much battery life has been lost, users often have to rely on the help of 3rd party software and applications. However, there is a simple way to determine how much battery level is that you No need to use 3rd party software, applications. To do this, please refer to the following article of Network Administrator.

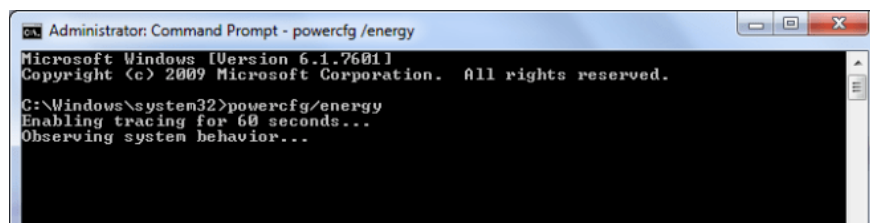

After a long time of use, your laptop battery will be gradually phased out. In order to determine how much battery life has been lost, users often have to resort to the support of 3rd party software and applications.

However, there is a simple way to determine how much battery level is that you don't need to use 3rd party software or applications. To do this, please refer to the following article of Quan. network treatment.

1. With laptop running Windows 7

To check the status of your Windows 7 laptop battery, you just need to open the Command Prompt under Admin, then enter the command below into the Command prompt:

```
powercfg / energy
```

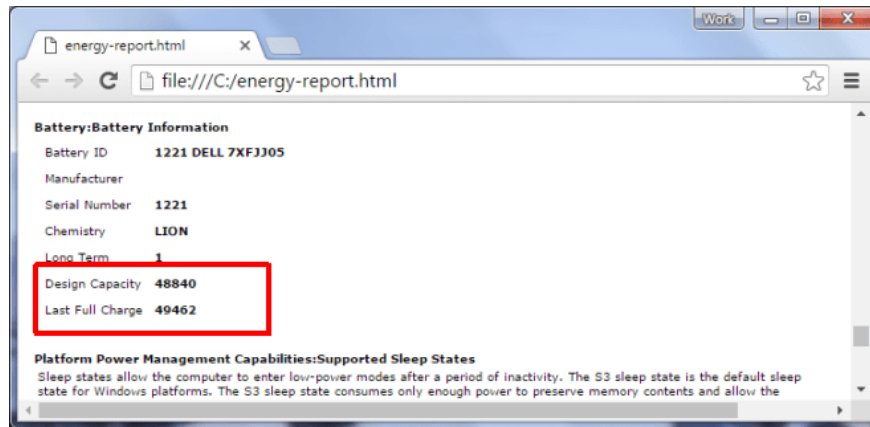

```
Administrator: Command Prompt - powercfg /energy
Microsoft Windows [Version 6.1.7601]
Copyright (c) 2009 Microsoft Corporation. All rights reserved.

C:\Windows\system32>powercfg/energy
Enabling tracing for 60 seconds...
Observing system behavior...
```

The execution of the command will take a little longer. After the command is done, it will tell you where to store your laptop battery level report.

Open the report on your browser and search for **Battery Information** . Here you can check your battery parameters, Design Capacity values ??and Full Charge value.

You can see the screenshot below, after executing the command, the Full Charge value is higher than the Design Capacity value on the system.

If the Full Charge value is lower than the Design Capacity value, your laptop battery is at an alarming level, then you can think of a solution to replace the battery.

2. Laptop Windows 8 and Windows 10

To check the laptop battery level of Windows 8 and Windows 10, open Command Prompt under Admin and enter the following command into the Command Prompt window:

```
powercfg / batteryreport
```

Wait a few seconds for the command to execute and create a report for you, then open the report on your browser. Creating reports on Windows 8 and Windows 10 is much simpler and easier to read than Windows 7.

Next, look for **Battery life estimates** and compare Full Charge and Design Capacity values. If the Full Charge value is lower, you need to consider replacing a new laptop battery.

In the example image below, you can see the laptop battery has been 'dead' and no longer charging:

Battery life estimates
Battery life estimates based on observed drains

PERIOD	AT FULL CHARGE		AT DESIGN CAPACITY	
	ACTIVE	CONNECTED STANDBY	ACTIVE	CONNECTED STANDBY
