

# Opera introduces Aria, a cool AI browser assistant

Opera, one of the world's most popular web browser platforms, has just released an integrated AI utility that acts as an intelligent virtual assistant called Aria.

This exciting virtual assistant is completely powered by artificial intelligence algorithms, and is designed to help enhance the browsing experience for Opera users.

The way Aria actually works is also not complicated. This virtual assistant will take full advantage of OpenAI's GPT technology to provide general AI services for free in the browser itself, opening up new possibilities for user-AI collaboration.

Aria is basically built on Opera's innovative 'Composer' architecture, providing various intelligent functions to users. Whether you're performing a web search query, composing a document, asking for code, or searching for product information, Aria can help you live in the form of a chat interface, allowing for seamless interaction with capabilities of AI. In addition, it incorporates real-time browsing results, further enhancing the user experience.

In addition, Aria's underlying Composer infrastructure allows connectivity to multiple AI models, with plans to expand and add other capabilities in the future. This expansion includes a partnership with Opera partners to incorporate other search services into Aria.

Aria will be accessible in over 180 countries across a variety of platforms. Opera PC users can access Aria by downloading the latest version of Opera One (development version) while Android users can opt for the beta version of Opera (download from Google Play store).

With Aria integrated into Opera, users can now leverage the power of AI in their browsing activities, as well as benefit from real-time access to internet content. By seamlessly integrating AI services into the browser, Opera wants to breathe new life into the browsing experience and provide users with enhanced capabilities for a variety of tasks.
