

Oppo officially confirmed N3 will use rare metal shell frames

After posting promotional images about the Oppo N3 will use ultra-durable, ultra-light metal, the company continues to post new photos of the structure and features of the chassis on the device.

After posting promotional images about the Oppo N3 will use ultra-durable, ultra-light metal, the company continues to post new photos of the structure and features of the chassis on the device.

At this point, you can be sure that the **Oppo N3** will use ultra-light lithium-aluminum alloy - a material in the aerospace industry, it is thin but durable, sturdy, stainless.

Rare metal frame

The device will also have an additional rotating top camera similar to the Oppo N1. In addition, more information indicates that Oppo N3 will use new cooling technology. The phone will have two variants, one of which is a lithium-aluminum alloy, and an unknown version made of what material.

Super light

The internal specifications are still mysterious but normally Oppo will integrate very powerful configuration.
