

Outlook starts updating the dark interface (Dark mode) to users and this is how to activate it

Microsoft has just released a major change that allows users to use Outlook.com's new (beta) interface to convert the interface to Dark Mode.

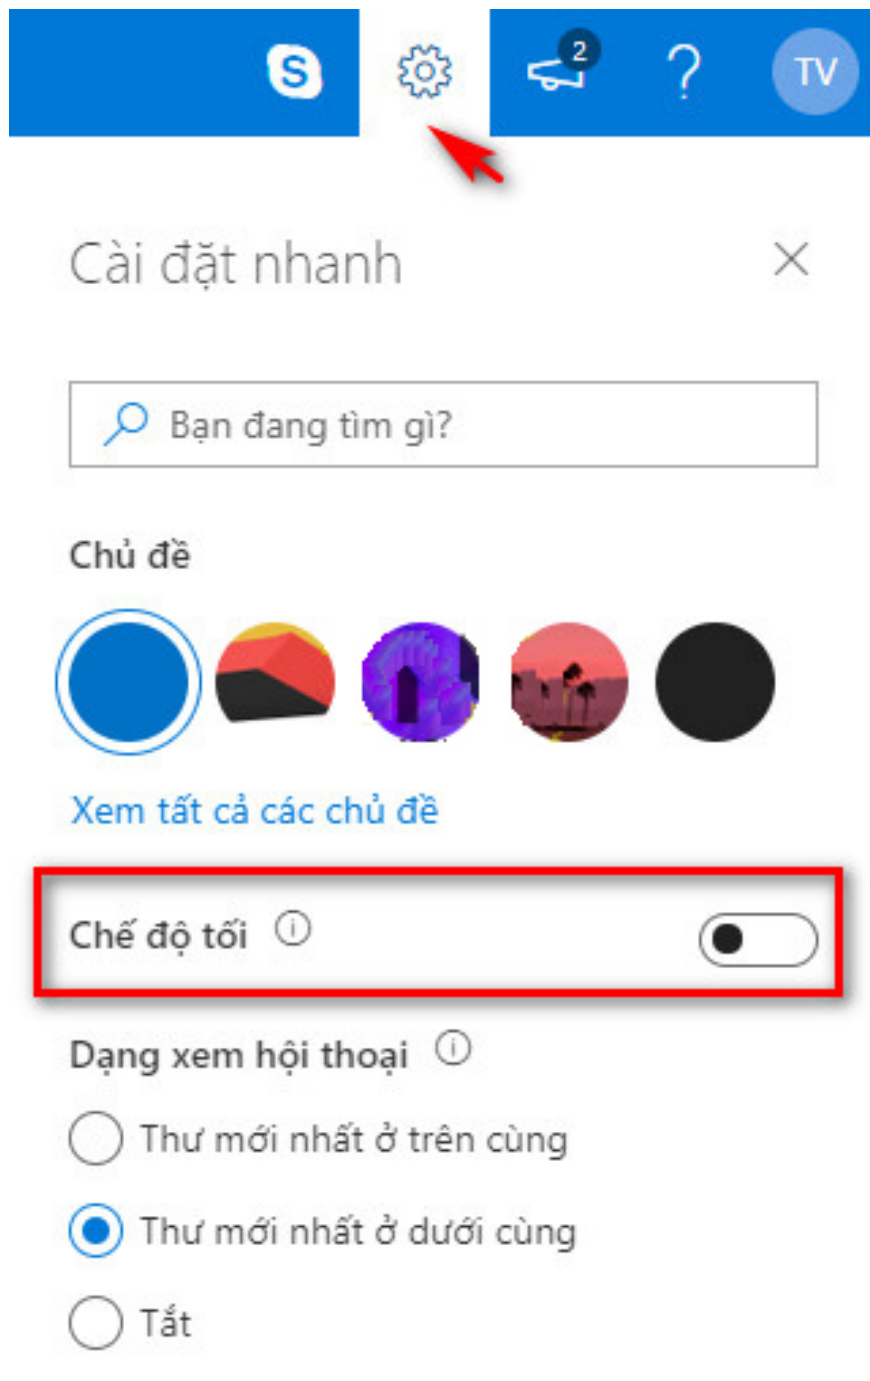

Microsoft has released a major change that allows users to use Outlook's new (beta) interface to convert the interface to Dark Mode. According to Microsoft, this dark interface helps reduce eye pain for users and for those who are using devices with OLED screens, it may somewhat save battery power.

Currently, all Outlook users participating in the beta program receive a nice dark mode (Dark mode).

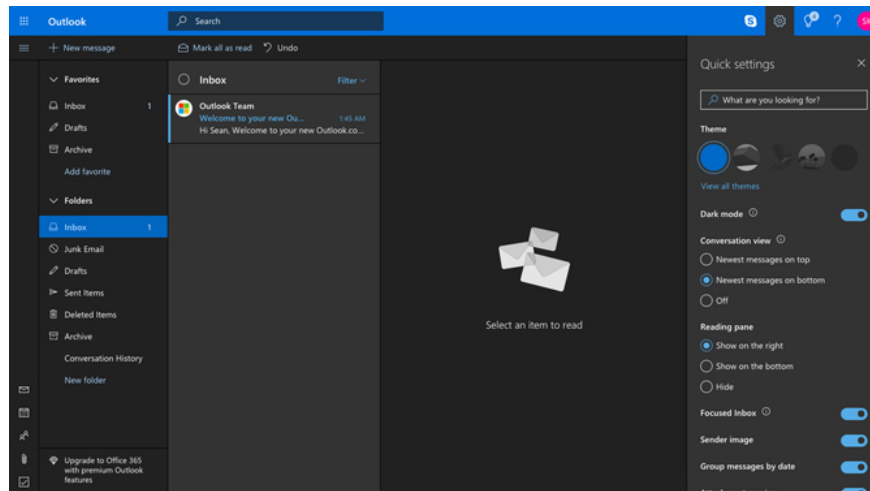

Microsoft will select random users to participate in the beta experience. If you go to Outlook.com and see the following message window, click on **Try it** to update the new interface.

When the new interface is activated, click on the quick setting column on the right of the screen and turn on **the** Dark mode option.

After completing the above steps, your Outlook will receive the Dark mode interface as shown below:
