Perhaps within a short time Palm's WebOS operating system will be officially redirected to "serve" mobile devices such as tablets or compact notebooks. However, it seems that now users can try to see how WebOS runs on a PC.

Basically, Palm WebOS also runs on an emulator for Windows. While this mobile operating system version is designed for ARM-based processors, older desktop or laptop lines use x86 processors. A member of the PreCentral forum, decided to test the launch of WebOS on the PC by copying the emulator file to the hard drive and trying to boot from it.

However, WebOS will only run on hard drives with IDE connections that cannot be compatible with SATA types at this time. The operating system does not support the device, but instead the user must use a keyboard or a touch screen.

Here is the WebOS video running on the Dell Latitude C600.
